Reliability Standard CIP-011-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-X Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-X Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-X Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-X Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-X Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-X Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-X Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-X Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-X)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity

must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. ~~2.~~ First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

Description of Current Draft

This draft standard is being posted for an additional ~~initial~~ comment and ballot to ballot the removal of "identify, assess, and correct" language. The draft includes modifications to meet the ~~directives of~~ FERC Order No. 791 directive to remove or modify the "identify, assess, and correct" language from CIP-011.

Anticipated Actions	Anticipated Date
~~First 45-Day Comment Period Opens~~	~~June 2014~~
Additional 45-Day Comment Period ~~(if necessary)~~	~~August~~ September 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
X	June 2014	Responding to FERC Order No. 791.	Revised

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~1~~X

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~1~~X:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

Reliability Standard CIP-011-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Background:

Standard CIP-011 ~~-1~~ exists as part of a suite of CIP Standards related to cyber security, which~~. CIP-002-5~~ require~~s~~ the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

~~Each Responsible Entity shall implement, **in a manner that identifies, assesses, and corrects deficiencies, . . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it~~-~~ believes necessary in ~~their~~ its documented processes, but ~~they~~ it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~1~~ X Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~1~~ X -Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ X Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~1~~ X Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~1~~ X Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~1~~ X Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~ X Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~1~~ X Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as the Compliance Enforcement Authority ("CEA") unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~X)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity

must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

Low Impact BES Cyber System Electronic Access Point (LEAP): A Cyber Asset interface that allows Low Impact External Routable Connectivity. The Cyber Asset may reside at a location external to the asset or assets containing low impact BES Cyber Systems. The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System.

Low Impact External Routable Connectivity (LERC): Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s). Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from assets containing low impact BES Cyber Systems are excluded (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

Removable Media: Media, directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, or access data. Removable Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.

Transient Cyber Asset: A Cyber Asset, (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Definitions of Terms Used in Standards

This section includes all newly defined or revised terms used in the proposed standards. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standards are approved. When the standards become effective, these defined terms will be added to the Glossary.

BES Cyber Asset (BCA): A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. ~~A Transient Cyber Asset is not a BES Cyber Asset.~~

Protected Cyber Assets (PCA): One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. ~~A Transient Cyber Asset is not a Protected Cyber Asset.~~

Removable Media: ~~Portable media~~Media, directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, ~~and/~~or access data. Removable Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. ~~A Cyber Asset is not Removable Media.~~

Transient Cyber Asset: A Cyber Asset, (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems.
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP.

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	Media, directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, or access data. Removable Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.
Transient Cyber Asset	A Cyber Asset, directly connected (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not

	limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Low Impact BES Cyber System Electronic Access Point (LEAP)	A Cyber Asset interface that allows Low Impact External Routable Connectivity. The Cyber Asset may reside at a location external to the asset or assets containing low impact BES Cyber Systems. The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System.
Low Impact External Routable Connectivity (LERC)	Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s). Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from assets containing low impact BES Cyber Systems are excluded (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. <u>CIP-003-6 — Cyber Security — Security Management Controls</u>

   Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the

first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-003-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Requirement R2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 1

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 3

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 4

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

2. CIP-004-6 — Cyber Security — Personnel and Training

   Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security

   Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-006-6, Requirement R1, Part 1.10

   For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-6 —Cyber Security — Systems Security Management

   Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable

governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-2 — Cyber Security — Configuration Change Management

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-010-2, Requirement R4

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

7. CIP-011-2 — Cyber Security — Information Protection

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

The new and modified NERC Glossary Terms Low Impact BES Cyber System Electronic Access Point and Low Impact External Routable Connectivity shall become effective on the same compliance date as when Reliability Standard CIP-003-6, Requirement R2 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall

become effective the same compliance date as when Reliability Standard CIP-003-6, Requirement R2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

9. Standards for Retirement

   Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[1] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

~~June 2~~September 3, 2014

Requested Approvals

- CIP-003-6 — Cyber Security — Security Management Controls
- CIP-004-6 — Cyber Security — Personnel and Training
- CIP-006-6 — Cyber Security — Physical Security
- CIP-007-6 — Cyber Security — Systems Security Management
- CIP-009–6 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-2 — Cyber Security — Configuration Change Management
- CIP-011-2 — Cyber Security — Information Protection

Requested Retirements

- CIP-003-5 — Cyber Security — Security Management Controls
- CIP-004-5 — Cyber Security — Personnel and Training
- CIP-006-5 — Cyber Security — Physical Security
- CIP-007-5 — Cyber Security — Systems Security Management
- CIP-009-5 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-1 — Cyber Security — Configuration Change Management
- CIP-011-1 — Cyber Security — Information Protection

Prerequisite Approvals

None

Revisions to Defined Terms in the NERC Glossary

The standards drafting team proposes modifying the following defined terms in the NERC Glossary:

BES Cyber Asset (BCA)	A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its required operation, misoperation, or non-operation, adversely impact one or more Facilities, systems, or equipment, which, if destroyed, degraded, or otherwise rendered unavailable when needed, would affect the reliable operation of the Bulk Electric System. Redundancy of affected Facilities, systems, and equipment shall not be considered when determining adverse impact. Each BES Cyber Asset is included in one or more BES Cyber Systems. ~~A Transient Cyber Asset is not a BES Cyber Asset.~~
Protected Cyber Asset (PCA)	One or more Cyber Assets connected using a routable protocol within or on an Electronic Security Perimeter that is not part of the highest impact BES Cyber System within the same Electronic Security Perimeter. The impact rating of Protected Cyber Assets is equal to the highest rated BES Cyber System in the same ESP. ~~A Transient Cyber Asset is not a Protected Cyber Asset.~~

The standards drafting team proposes the following new defined terms for incorporation into the NERC Glossary:

Removable Media	~~Portable media~~Media, directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, ~~and/~~or access data. Removable Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory. ~~A Cyber Asset is not Removable Media.~~
Transient Cyber Asset	A Cyber Asset, directly connected (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not

	limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.
Low Impact BES Cyber System Electronic Access Point (LEAP)	A Cyber Asset interface that allows Low Impact External Routable Connectivity. The Cyber Asset may reside at a location external to the asset or assets containing low impact BES Cyber Systems. The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System.
Low Impact External Routable Connectivity (LERC)	Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s). Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from assets containing low impact BES Cyber Systems are excluded (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-6 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the

first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-003-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R1, Part 1.2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Requirement R2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 1

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 1 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 2

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 3

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

Compliance Date for CIP-003-6, Attachment 1, element 4

Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

2. CIP-004-6 — Cyber Security — Personnel and Training

Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three~~six~~ calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-6 —Cyber Security — Systems Security Management

Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the

first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until ~~six~~ nine calendar months after the effective date of Reliability Standard CIP-007-6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-2 — Cyber Security — Configuration Change Management

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-010-2, Requirement R4

Registered Entities shall not be required to comply with Reliability Standard CIP-010-2, Requirement R4 until nine calendar months after the effective date of Reliability Standard CIP-010-2.

7. CIP-011-2 — Cyber Security — Information Protection

   Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. New and Modified NERC Glossary Terms

   The new and modified NERC Glossary Terms BES Cyber Asset, Protected Cyber Asset, Removable Media, and Transient Cyber Asset shall become effective on the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-010-2, Requirement R4 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   The new and modified NERC Glossary Terms Low Impact BES Cyber System Electronic Access Point and Low Impact External Routable Connectivity shall become effective on the same compliance date as when Reliability Standard CIP-003-6, Requirement R2 is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the same compliance date as when Reliability Standard CIP-003-6, Requirement R2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

9. Standards for Retirement

   Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[1] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

September 3, 2014

The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X implementation plan is posted in a clean version although it draws upon the implementation plan from the previous posting and only includes language for those standards balloted as version X.

Requested Approvals

- CIP-003-X — Cyber Security — Security Management Controls
- CIP-004-X — Cyber Security — Personnel and Training
- CIP-007-X — Cyber Security — Systems Security Management
- CIP-010-X — Cyber Security — Configuration Change Management
- CIP-011-X — Cyber Security — Information Protection

Requested Retirements

- CIP-003-5 — Cyber Security — Security Management Controls
- CIP-004-5 — Cyber Security — Personnel and Training
- CIP-007-5 — Cyber Security — Systems Security Management
- CIP-010-1 — Cyber Security — Configuration Change Management
- CIP-011-1 — Cyber Security — Information Protection

Prerequisite Approvals

None

Revisions to Defined Terms in the NERC Glossary

None

General Considerations

The results of the initial CIP V5 Revisions ballot showed industry support for the new communication networks requirements and the removal of the identify, assess, and correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015.

The CIP-003-6 and CIP-010-2 revisions proposed to address the low impact and transient devices directives did not pass initial ballot. As a prudent approach and in order to meet the FERC filing deadline of February 3, 2015 for the two directives, the SDT would like to ballot the IAC revisions on their own without the low impact and transient devices revisions. Assuming the IAC revisions pass the second ballot, these standards can proceed to final ballot along with the communication networks revisions.

The SDT emphasizes that this is NOT an indication that it plans to separate the revision work. Strong progress continues on the low impact and transient devices revisions, and the SDT still hears support from stakeholders to complete all four directive areas of FERC Order No. 791 revisions at the same time. The request for a separate ballot is a practical measure to avoid potential complications with meeting FERC's directive deadlines that, if we were to wait until after the second ballot, time may not allow us to address.

The SDT plans to post a single ballot for the standards that need stakeholder approval for the IAC language removal. These proposed standards will be version X for the ballot. The version X ballot will be posted along with the other revision proposals designated with the appropriate version number. This allows for the simultaneous revision of the standards to address the directive issue areas and when both the version X and the numbered version standards pass ballot, the revisions can be combined into the appropriate numbered standard version.

Effective Dates

The effective dates for each of the proposed Reliability Standards and NERC Glossary terms are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date

that entities must begin to comply with that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-X — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-X, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-X, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-X.

2. CIP-004-X — Cyber Security — Personnel and Training

   Reliability Standard CIP-004-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-007-X —Cyber Security — Systems Security Management

   Reliability Standard CIP-007-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the

first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-X, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-X, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-X.

4. CIP-010-X — Cyber Security — Configuration Change Management

Reliability Standard CIP-010-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

5. CIP-011-X — Cyber Security — Information Protection

Reliability Standard CIP-011-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. Standards for Retirement

   Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.
- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

Unofficial Comment Form

Project 2014-02 CIP Version 5 Revisions – Cyber Security Standards

Please **DO NOT** use this form for submitting comments. Please use the electronic form to submit comments on the proposed draft CIP standards. The electronic comment form must be completed **by 8 p.m. Eastern on Friday, October 17, 2014**.

All documents and information about this project are available on the project page. If you have questions please contact Marisa Hecht at marisa.hecht@nerc.net or by telephone at 404-446-9620 or Ryan Stewart at ryan.stewart@nerc.net or by telephone at 202-644-8091.

Background Information

On November 22, 2013, FERC issued Order No. 791, *Version 5 Critical Infrastructure Protection Reliability Standards*. In this order, FERC approved version 5 of the CIP standards, and also directed that NERC make the following modifications to those standards:

1. Modify or remove the "identify, assess, and correct" language in 17 CIP version 5 requirements.
2. Develop modifications to the CIP standards to address security controls for Low Impact assets.
3. Develop requirements that protect transient electronic devices.
4. Create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

FERC directed NERC to submit new or modified standards responding to the directives related to the "identify, assess, and correct" language and communication networks by February 3, 2015, one year from the effective date of FERC Order No. 791. FERC did not place any time frame for NERC to respond to the Low Impact and transient electronic devices directives.

You do not have to answer all questions. Enter comments in simple text format. Bullets, numbers, and special formatting will not be retained.

Questions

1. For the requirements applicable to Low Impact assets, the Standard Drafting Team (SDT) changed the structure of CIP-003-6, Requirements R1 and R2 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-003-6 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No:

   Comments:

2. The SDT proposed new definitions **Low Impact External Routable Connectivity** and **Low Impact BES Cyber System Electronic Access Point** to clarify the requirement language in CIP-003-6. Do you agree with the proposed new definitions? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

3. For the requirements applicable to transient devices, the SDT changed the structure of CIP-010-2, Requirement R4 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-010-2 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No:

   Comments:

4. The SDT revised the proposed new definitions for Transient Cyber Assets and Removable Media to address issues raised in stakeholder comments. Do you agree with the proposed definitions? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

5. In response to stakeholder comments, the SDT revised the implementation deadlines. The implementation plan now includes tiered deadlines for the aspects of CIP-003-6. The CIP-007-6 timeframe is now consistent with CIP-006-6. Are these timeframes reasonable and appropriate? If not please explain specifically which implementation plan item needs adjusting and include the rationale for the suggested change.

Yes:

No:

Comments:

6. The results of the initial CIP V5 Revisions ballot showed industry support for the new Communication Networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015. Meanwhile, the CIP-003-6 and CIP-010-2 revisions proposed to address the Low Impact and Transient Devices directives did not pass initial ballot.

   In order to separate approval of the IAC and Communication Networks revisions from the Low Impact and Transient Device revisions where they occur within the same standard, the relevant standards are posted separately. This separate posting provides additional options to meet the FERC filing deadline of February 3, 2015 in the event Low Impact or Transient Device revisions do not obtain industry approval in the current ballot. (Please see explanatory document on the CIP Version 5 Revisions project page for more information)

   Do you support removal of the IAC language from the 17 Requirements across CIP Version 5 Standards? If not, please explain why.

   Yes:

   No:

   Comments:

7. Do you have input not discussed in the questions above on other areas relative to the revisions made to the standards or implementation plan since the initial posting and within the scope of the Standards Authorization Request? If so, please provide them here, recognizing that you do not have to provide a response to all questions.

   Yes:

   No:

   Comments:

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CIP V5 Revisions - Version X Ballot

The results of the initial CIP V5 Revisions ballot showed industry support for the new communication networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015.

The CIP-003-6 and CIP-010-2 revisions proposed to address the low impact and transient devices directives did not pass initial ballot. Stakeholder comments have been addressed by the Standard Drafting Team (SDT) and these standards are being posted for this additional comment and ballot period. However, as a prudent approach and in order to meet the FERC filing deadline of February 3, 2015 for the two directives, the SDT is also balloting the IAC revisions in a separate version of the standards (CIP-003-X and CIP-010-X) without the Low Impact and Transient Devices revisions. In the event that CIP-003-6 or CIP-010-2 do not pass, and the IAC revisions in the version X standards pass, these standards can proceed to final ballot along with the communication networks revisions.

The SDT emphasizes that this is NOT an indication that it plans to separate the revision work. Strong progress continues on the low impact and transient devices revisions, and the SDT still hears support from stakeholders to complete all four directive areas of FERC Order No. 791 revisions at the same time. The request for a separate ballot is a practical measure to avoid potential complications with meeting FERC's directive deadlines that, if we were to wait until after the second ballot, time may not allow us to address.

Posting Plan

The SDT plans to post a single ballot for the standards that need stakeholder approval for the IAC language removal. These proposed standards will be version X for the ballot. The version X ballot will be posted alongside CIP-003-6 and CIP-010 designated with the appropriate version number. This allows for the simultaneous revision of the standards to address the directive issue areas and when both the version X and the numbered version standards pass ballot, the revisions can be combined into the appropriate numbered standard version. The following standards will be posted for ballot of the IAC language removal (proposed redline standards attached):

- CIP-003-X
- CIP-004-X
- CIP-007-X
- CIP-010-X
- CIP-011-X

For CIP-004-X, CIP-007-X, and CIP-011-X, the SDT will not post the version 6 of those standards because they already passed initial ballot. However, since these version 6 standards also contain transient devices revisions, the SDT would like to ballot the version X standards without the revisions addressing transient devices for industry approval on the removal of the IAC language.

The difference between CIP-007-X and CIP-007-6 is the capitalization of "Removable Media" in CIP-007-6. The SDT removed the capitalization in CIP-007-X because should CIP-010-6 fail to pass stakeholder ballot, then the reference to the defined term in CIP-007 would be inaccurate. CIP-007-X also contains the revisions made relative to the

communication networks directive that passed ballot in the initial posting. It is necessary to include both the communication network and IAC revisions in version X of the standard order to have CIP-007 ready for final ballot should the transient device revisions not pass ballot in time.

CIP-011-X removed guidance language references Transient Cyber Assets and Removable Media. CIP-004-X removed language in the requirements that included Transient Cyber Assets and Removable Media.

Stakeholders will be asked to place one vote to approve the IAC language removal from all of the CIP V5 Revision version X standards posted for ballot.

Timing

The Version X revisions will be posted concurrently with the second comment and ballot posting of the low impact and transient devices revisions. See below for the planned balloting schedule.

Ballot Schedule

	Initial Ballot - June 2-July 16	Initial/Addl Ballot - Aug 29-Oct 14	Final Ballot - Oct 31- Nov 10, if all pass **	Final Ballot - Oct 31- Nov 10, if separated***
Version-X*		post		post
CIP-003-6	~ 35%	post	post	
CIP-004-6	passed		post	
CIP-006-6	passed		post	post
CIP-007-6	passed		post	
CIP-009-6	passed		post	post
CIP-010-2	~ 49%	post	post	
CIP-011-2	passed		post	
Definitions - Lows		post	post	
Definitions - TD	passed	post	Post	
IP-V6		post	post	
* Version-X ballot includes: CIP-003, CIP-004, CIP-007, CIP-010, CIP-011, and an implementation plan. CIP-004-6, CIP-007-6 and CIP-011-2 contain reference to the new definitions associated with transient devices.				
** if all revisions pass, the IAC removal will be reflected in the fully revised version posted for final ballot.				
*** If separated, the IAC-X standards will adopt the appropriate version number.				
Schedule is subject to change.				

Implementation Plan

The Implementation Plan deadlines for the IAC requirements will remain effectively unchanged from Version 5 (see posted Version X implementation plan).

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791
September 3, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
106	Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact	The SDT revised Requirements R1 and R2 of CIP-003-6 to include additional specificity regarding the processes that responsible entities must have for low impact BES Cyber Systems. In addition, the SDT developed objective criteria

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.	surrounding the controls for some entities based on asset-type and routable communications. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category. To better define the protection required for low impact BES Cyber System electronic communication, the terms Low Impact BES Cyber System External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) have been added to the NERC Glossary of Terms. These help define the concept of security controls targeted for communication paths at a facility-site level. The SDT confined these revisions in CIP-003-6, Requirements R1 and R2 to the following areas: 1. **Cyber Security Policy:** R1.2 requires a policy addressing the four cyber security subject matter areas specified in the R2 cyber security plan. 2. **Cyber Security Plan(s):** R2 requires the development and implementation of one or more cyber security plan(s) for an entity's low impact BES Cyber System(s). The cyber security plan must cover the 4 areas as

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		specified in Attachment 1 of CIP-003-6: a. **Cyber Security Awareness:** Attachment 1, element 1 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices. The SDT determined that adding intervals increases the auditability of the requirement part. b. **Physical Security Controls:** Attachment 1, element 2 and its subparts require controls to restrict physical access to low impact BES Cyber Systems as well as Low Impact BES Cyber System Electronic Access Points (LEAP) used for controlling access as specified in element 3. c. **Electronic Access Controls:** Attachment 1, element 3 and its subparts address protections around Low Impact BES Cyber System External Routable Connectivity (LERC) and Dial-up Connectivity. d. **Cyber Security Incident Response:** Attachment 1, element 4 and its subparts outline the criteria required to be in a Cyber Security Incident response plan.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section 1600 data request and will be working with the six study participants in developing the information needed for its filing.
132	Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of BES Cyber Asset. While we are persuaded that it would be unduly burdensome for responsible entities	The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which requires a Transient Cyber Asset and Removable Media plan to provide higher assurance against the propagation of malware when connecting transient devices.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.	The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition. The drafting team determined three distinct scenarios for entities to address in their plan(s) in which transient devices need specific protections: (i) Transient Cyber Assets owned or managed by the Responsible Entity, (ii) Transient Cyber Asset(s) owned or managed by vendors or contractors, and (iii) Removable Media. For Transient Cyber Assets owned or managed by the Responsible Entity, the SDT determined that entities manage these devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management. The controls for this scenario are more specific and recognize the relatively higher frequency in which these devices will be used.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		In the scenario in which contractors or vendors manage the Transient Cyber Assets, the required elements of the plan include those which an entity can verify at the point prior to connecting such as security patch management and malware prevention mechanisms. The security controls entities must apply to Removable Media have considerations for the type of device being protected and include authorization and scanning for malicious code. The Commission provided a list of security controls it expected NERC to consider for addressing transient devices. The consideration of each security element is described as follows: 1. **Device authorization as it relates to users and locations:** CIP-010-2 Requirement R4, Attachment 1 requires entities to authorize Transient Cyber Assets and Removable Media by individual(s) and location(s) prior to connecting them to the BES Cyber System. Vendor or contractor managed Transient Cyber Assets do not have this authorization because the scenario is often single-use and the entity already conducts an inspection and mitigation of the device prior to connection. **2. Software authorization:** The SDT considered controls relating to software authorization but decided against including specific software as part of the authorization performance because such authorization did not

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		contribute meaningfully to cyber security risk reduction. However, software authorization in the form of application whitelisting is provided as an option to mitigate malicious code. **3. Security patch management:** In CIP-010-2 R4, Attachment 1, both entity and vendor/contractor managed devices must have security patch management or other equivalent forms of mitigation to address security vulnerabilities in software. 4. **Malware prevention:** CIP-010-2 Requirement R4, Attachment 1 requires entities to have malware protection on the Transient Cyber Asset (for both entity- and vendor-managed Transient Cyber Assets) and for Removable Media prior to connection. 5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this control and determined this control best applies to entity-managed Transient Cyber Assets with the objective to mitigate the risk of unauthorized use. There are logistical challenges in applying this control to vendor-managed devices, in which the entity likely will have had no control until immediately prior to use. Furthermore, additional guidance is necessary in CIP-011-2 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		devices. The objective to address the unauthorized release of BES Cyber System Information is sufficiently addressed with the requirements in CIP-011-2 to protect and securely handle BES Cyber System Information. 6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. High, Medium, Low Impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-2 requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-2 Requirement R4.
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-6 Requirement Part 1.2 include applicability for non-programmable electronic components to

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The requirements modifications as well as the existing requirements have more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move	NERC modified the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[3] *See infra* P 223.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment	NERC modified the VRF assignment for CIP-004-5.1, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		timeframe contained in the VSLs from 90-210 days to 90-120 days.

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791

~~June 2~~September 3, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
106	Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact	The SDT revised Requirements R1 and R2 of CIP-003-6 to include additional specificity regarding the processes that responsible entities must have for low impact ~~facilities~~BES Cyber Systems. In addition, the SDT developed objective

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.	criteria surrounding the controls for some entities based on asset-type and ~~routability~~routable communications. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category. To better define the protection required for low impact BES Cyber System electronic communication, the terms Low Impact BES Cyber System External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) have been added to the NERC Glossary of Terms. These help define the concept of security controls targeted for communication paths at a facility-site level. The SDT confined these revisions in CIP-003-6, Requirements R1 and R2 to the following ~~four technical~~ areas: 1. **Cyber Security Policy:** R1.2 requires a policy addressing the four cyber security subject matter areas specified in the R2 cyber security plan. 2. **Cyber Security Plan(s):** R2 requires the development and implementation of one or more cyber security plan(s) for an entity's low impact BES Cyber System(s). The cyber security plan must cover the 4 areas as

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		specified in Attachment 1 of CIP-003-6: a. **Cyber Security Awareness:** Attachment 1, element 1 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices. The SDT determined that adding intervals increases the auditability of the requirement part. ~~a.~~b. **Physical Security Controls:** Attachment 1, element 2~~.2~~ and its subparts require controls to restrict physical access to ~~L~~low ~~Impact~~ impact BES Cyber Systems ~~and require additional protections for Controls Centers~~as well as Low Impact BES Cyber System Electronic Access Points (LEAP) used for controlling access as specified in element 3. ~~b.~~c. **Electronic Access Controls:** Attachment 1, element ~~2.~~3 and its subparts address protections around ~~external routable protocol paths~~Low Impact BES Cyber System External Routable Connectivity (LERC) and Dial-up Connectivity. ~~c.~~d. **Cyber Security Incident Response:** Attachment 1, element 4~~2.4~~ and its subparts outline the criteria required to be in a Cyber Security

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		Incident response plan. 2. ~~**Cyber Security Awareness:** Part 2.5 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices and Parts 2.2 through 2.4 of Requirement R2. The SDT determined that adding intervals increases the auditability of the requirement part.~~ ~~In addition to the revisions to the four technical areas, the SDT retained the requirement in Part 2.1 to obtain CIP Senior Manager approval of one or more documented policies that address the topics in Parts 2.2 – 2.5.~~
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale	~~NERC proposes to conduct a survey of Cyber Assets, pursuant to Section 1600 of the NERC *Rules of Procedure* (ROP), regarding the scope of the term "BES Cyber Asset." In accordance with Section 1600 of the ROP, NERC may request data or information from Registered Entities that is necessary to meet NERC's obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of FERC's regulations.~~ ~~The purpose of the proposed Data Request is to respond to FERC's directive from Order No. 791 to conduct a survey regarding the scope of the term "BES Cyber Asset" and submit~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	~~an informational filing based on the data collected by February 3, 2015.~~ Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section 1600 data request and will be working with the six study participants in developing the information needed for its filing.
132	Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of BES Cyber Asset. While we are persuaded that it would be unduly burdensome for responsible entities to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.	The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which requires a Transient Cyber Asset and Removable Media plan to~~includes a set of controls to~~ provide higher assurance against the propagation of malware ~~prior to~~when connecting transient devices. The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition. The drafting team determined three distinct scenarios for entities to address in their plan(s) in which transient devices need specific protections: (i) Transient Cyber Assets owned or

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		managed by the Responsible Entity, (ii) Transient Cyber Asset(s) owned or managed by vendors or contractors, and (iii) Removable Media. For Transient Cyber Assets owned or managed by the Responsible Entity, the SDT determined that entities manage these ~~transient~~ devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management. The controls for this scenario are more specific and recognize the relatively higher frequency in which these devices will be used. In the scenario in which contractors or vendors manage the Transient Cyber Assets, the required elements of the plan include those which an entity can verify at the point prior to connecting such as security patch management and malware prevention mechanisms. The security controls entities must apply to Removable Media have considerations for the type of device being protected and include authorization and scanning for malicious code.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		The Commission provided a list of security controls it expecteds NERC to consider for addressing transient devices., and Tthe consideration of each security element is described as follows: 1. **Device authorization as it relates to users and locations:** CIP-010-2 Requirement R4, Part 4.1 Attachment 1 requires entities to authorize Transient Cyber Assets and Removable Media by individual(s) and location(s) prior to connecting them to the BES Cyber System. Vendor or contractor managed Transient Cyber Assets do not have this authorization because the scenario is often single-use and the entity already conducts an inspection and mitigation of the device prior to connection. 2. **Software authorization:** CIP-010-2 Requirement R4, Part 4.1 borrows similar language from CIP-010-2 Requirement R4, Part 1.1 to authorize intentionally installed software on Transient Cyber Assets.The SDT considered controls relating to software authorization but decided against including specific software as part of the authorization performance because such authorization did not contribute meaningfully to cyber security risk reduction. However, software authorization in the form of application whitelisting is provided as an option to mitigate malicious code. 3. **Security patch management:** CIP-010-2 Requirement R4,

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~Part 4.7 requires entities to install patches on Transient Cyber Assets and Removable Media, at least once every 35 calendar days, or prior to use, in connecting to the BES Cyber System~~In CIP-010-2 R4, Attachment 1, both entity and vendor/contractor managed devices must have security patch management or other equivalent forms of mitigation to address security vulnerabilities in software. 4. **Malware prevention:** CIP-010-2 Requirement R4, ~~Part 4.2~~Attachment 1 requires entities to have malware protection on the Transient Cyber Asset (for both entity- and vendor-managed Transient Cyber Assets)~~. Requirement R4, Part 4.3 requires malware protectio and n~~ for Removable Media prior to connection~~, and Requirement R4, Part 4.5 requires up-to-date malware signatures~~. 5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this control and determined this control best applies to entity-managed Transient Cyber Assets with the objective to mitigate the risk of unauthorized use. There are logistical challenges in applying this control to vendor-managed devices, in which the entity likely will have had no control until immediately prior to use. Furthermore, A~~a~~the Reliability Standards already

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~address the vulnerabilities this control attempts to mitigate, and a~~dditional guidance is necessary in CIP-011-2 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient devices. ~~Specifically, the drafting team determined the two primary objectives in controlling physical access to transient devices are (1) preventing the introduction of malware and (2) preventing the unauthorized release of BES Cyber System Information.~~ The ~~latter~~ objective to address the unauthorized release of BES Cyber System Information is sufficiently addressed with the requirements in CIP-011-2 to protect and securely handle BES Cyber System Information~~. The objective to prevent the introduction of malware is sufficiently addressed through the malware protection requirement proposed for transient devices. Ensuring the physical protection of transient devices outside of the PSP is in some cases more burdensome to the entity than receiving the full protection of the Standard, and has minimal effect to prevent the introduction of malware~~. 6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. High, Medium, Low Impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-2 requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-2 Requirement R4.
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-6 Requirement Part 1.2 include applicability for non-programmable electronic components to prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The requirements modifications as well as the existing requirements have more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from	NERC modified the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	NERC modified the VRF assignment for CIP-004-5.1, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-6,

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the timeframe contained in the VSLs from 90-210 days to 90-120 days.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-6, CIP-004-6, CIP-006-6, CIP-007-6, CIP-009-6, CIP-010-2, and CIP-011-2 (CIP-002-5, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-6 R1	To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.
NEW	CIP-003-6 R1.1	"For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.
CIP-003-5 R1.1	CIP-003-6 R1.1.1	Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-6.
CIP-003-5 R1.2	CIP-003-6 R1.1.2	No change.
CIP-003-5 R1.3	CIP-003-6 R1.1.3	No change.
CIP-003-5 R1.4	CIP-003-6 R1.1.4	No change.
CIP-003-5 R1.5	CIP-003-6 R1.1.5	No change.
CIP-003-5 R1.6	CIP-003-6 R1.1.6	No change.
CIP-003-5 R1.7	CIP-003-6 R1.1.7	No change.
CIP-003-5 R1.8	CIP-003-6 R1.1.8	No change.
CIP-003-5 R1.9	CIP-003-6 R1.1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-6 R1.2	"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.
CIP-003-5 R2	CIP-003-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1."
CIP-003-5 R2.1	CIP-003-6 R1.2.1	The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.1.
CIP-003-5 R2.2	CIP-003-6, R1.2.2	The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.2.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.3	CIP-003-6 R1.2.3	The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity."
CIP-003-5 R2.4	CIP-003-6 R1.2.4	The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.4.
NEW	CIP-003-6, Attachment 1	CIP-003-6 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.
CIP-003-5 R3	CIP-003-6 R3	No change.
CIP-003-5 R4	CIP-003-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-6 R1	No change.
CIP-004-5.1 R1.1	CIP-004-6 R1.1	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2	CIP-004-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement “a cyber security training program(s).” That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-6 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-6 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-6 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-6 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-6 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-6 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-6 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-6 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-6 R2.1.8	No change.
CIP-004-5.1 R2.1.9	CIP-004-6 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity’s cyber security training program. The training must address cyber security risks associated with a BES Cyber System’s electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-6 R2.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.3	CIP-004-6 R2.3	No change.
CIP-004-5.1 R3	CIP-004-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R3.1	CIP-004-6 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-6 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-6 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-6 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-6 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-6 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-6 R3.5	No change.
CIP-004-5.1 R4	CIP-004-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R4.1	CIP-004-6 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-6 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-6 R4.1.2	No change.
CIP-004-5.1 R4.1.3	CIP-004-6 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-6 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-6 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-6 R4.4	No change.
CIP-004-5.1 R5	CIP-004-6 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.
CIP-007-5 R3	CIP-007-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R3.1	CIP-007-6 R3.1	No change.

CIP-010-1 R3.2	CIP-010-2 R3.2	No change.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R3.2.1	CIP-010-2 R3.2.1	No change.
CIP-010-1 R3.2.2	CIP-010-2 R3.2.2	No change.
CIP-010-1 R3.3	CIP-010-2 R3.3	No change.
CIP-010-1 R3.4	CIP-010-2 R3.4	No change.
NEW	CIP-010-2 R4	To respond to the FERC Order No. 791 directive to address transient devices, the SDT modified its approach to use Attachment 1 instead of the table approach. It modified Requirement R4 to "implement one or more documented plan(s) for Transient Cyber Asset and Removable Media that include the applicable elements in Attachment 1, except under CIP Exceptional Circumstances."
NEW	CIP-010-2, Attachment 1	CIP-010-2 Attachment 1 lists the elements required for Transient Cyber Asset and Removable Media Plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the risks posed by transient devices.

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-2 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-011-1 R1.1	CIP-011-2 R1.1	No change.
CIP-011-1 R1.2	CIP-011-2 R1.2	No change.
CIP-011-1 R2	CIP-011-2 R2	No change.
CIP-011-1 R2.1	CIP-011-2 R2.1	No change.
CIP-011-1 R2.2	CIP-011-2 R2.2	No change.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-6, CIP-004-6, CIP-006-6, CIP-007-6, CIP-009-6, CIP-010-2, and CIP-011-2 (CIP-002-5, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-6 R1	~~No change.~~ To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.
~~CIP-003-5 R1.1~~NEW	CIP-003-6 R1.1	~~No change.~~ "For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.
CIP-003-5 R1.1	CIP-003-6 R1.1.1	Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-6.
CIP-003-5 R1.2	CIP-003-6 ~~R1.2~~R1.1.2	No change.
CIP-003-5 R1.3	CIP-003-6 ~~R1.3~~R1.1.3	No change.
CIP-003-5 R1.4	CIP-003-6 ~~R1.4~~R1.1.4	No change.
CIP-003-5 R1.5	CIP-003-6 ~~R1.5~~R1.1.5	No change.
CIP-003-5 R1.6	CIP-003-6 ~~R1.6~~R1.1.6	No change.
CIP-003-5 R1.7	CIP-003-6 ~~R1.7~~R1.1.7	No change.
CIP-003-5 R1.8	CIP-003-6 ~~R1.8~~R1.1.8	No change.
CIP-003-5 R1.9	CIP-003-6 ~~R1.9~~R1.1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-6 R1.2	"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.
CIP-003-5 R2	CIP-003-6 R2~~, CIP-003-6, R2.1~~	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1." ~~The main requirement was modified to follow a similar structure to parent Requirements of those requirement parts in the table format.~~ ~~The CIP Senior Manager review and approval at least once every 15 months was mapped to CIP-003-6 R2.1.~~
CIP-003-5 R2.1	~~CIP-003-6 R2.6~~ CIP-003-6 R1.2.1	The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.1. ~~The security awareness requirement part was mapped to Part 2.6 to reinforce cyber security practices at least quarterly, while addressing Parts 2.2 through 2.5 once every 15 calendar months. This added objective criteria to security awareness, while not to the rigor of Medium and High BES Cyber Systems.~~

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.2	~~CIP-003-6 R2.2~~ CIP-003-6, R1.2.2	The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.2. ~~Expanding the physical security controls, Part 2.2 addresses operational or procedural control(s) to restrict physical access.~~
~~NEW~~	~~CIP-003-6 R2.3~~	~~Expanding the physical security controls, Part 2.3 requires implementation of processes to include Parts 2.3.1 and 2.3.2 for low impact BES Cyber Systems at Control Centers.~~
~~NEW~~	~~CIP-003-6 R2.3.1~~	~~Expanding the physical security controls, Part 2.3.1 addresses escorted access of visitors at Control Centers.~~
~~NEW~~	~~CIP-003-6 R2.3.2~~	~~Expanding the physical security controls, Part 2.3.2 addresses monitored physical access point(s) at Control Centers with external routable protocol paths.~~
CIP-003-5 R2.3	~~CIP-003-6 R2.4~~ CIP-003-6 R1.2.3	The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity." ~~The electronic access controls were added as Part 2.4. The documented process(es) collectively must include Parts 2.4.1 through 2.4.3.~~

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
~~NEW~~	~~CIP-003-6 R2.4.1~~	~~Expanding the electronic access controls, Part 2.4.1 addresses all external routable protocol paths, if any, as needing to be through one or more identified access point(s).~~
~~NEW~~	~~CIP-003-6 R2.4.2~~	~~Expanding the electronic access controls, Part 2.4.2 addresses requiring inbound and outbound access permissions for each identified access point, including the reason for granting access, and deny all other access by default.~~
~~NEW~~	~~CIP-003-6 R2.4.3~~	~~Expanding the electronic access controls, Part 2.4.3 addresses authentication when establishing Dial-Up Connectivity, per Cyber Asset capability.~~
CIP-003-5 R2.4	~~CIP-003-6 R2.5~~ CIP-003-6 R1.2.4	The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.4. ~~The incident response to a Cyber Security Incident requirement part remains in Part 2.5. The documented response plan(s) collectively must include Parts 2.5.1 through 2.5.6.~~
~~NEW~~	~~CIP-003-6 R2.5.1~~	~~Expanding the incident response controls, Part 2.5.1 address the identification, classification, and response to Cyber Security Incidents.~~
~~NEW~~	~~CIP-003-6 R2.5.2~~	~~Expanding the incident response controls, Part 2.5.2 addresses whether an identified Cyber Security Incident is reportable.~~
~~NEW~~	~~CIP-003-6 R2.5.3~~	~~Expanding the incident response controls, Part 2.5.3 addresses the notification of Reportable Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center.~~

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
~~NEW~~	~~CIP-003-6 R2.5.4~~	~~Expanding the incident response controls, Part 2.5.4 addresses the roles and responsibilities of Cyber Security Incident response groups or individuals.~~
~~NEW~~	~~CIP-003-6 R2.5.5~~	~~Expanding the incident response controls, Part 2.5.5 addresses the incident handling procedures for Cyber Security Incidents.~~
~~NEW~~	~~CIP-003-6 R2.5.6~~	~~Expanding the incident response controls, Part 2.5.6 addresses the testing of the plan(s) at least once per 36 calendar months.~~
NEW	CIP-003-6, Attachment 1	CIP-003-6 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.
CIP-003-5 R3	CIP-003-6 R3	No change.
CIP-003-5 R4	CIP-003-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-6 R1	No change.
CIP-004-5.1 R1.1	CIP-004-6 R1.1	No change.
CIP-004-5.1 R2	CIP-004-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement "a cyber security training program(s)." That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-6 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-6 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-6 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-6 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-6 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-6 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-6 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-6 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-6 R2.1.8	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.1.9	CIP-004-6 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity's cyber security training program. The training must address cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-6 R2.2	No change.
CIP-004-5.1 R2.3	CIP-004-6 R2.3	No change.
CIP-004-5.1 R3	CIP-004-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-004-5.1 R3.1	CIP-004-6 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-6 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-6 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-6 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-6 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-6 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-6 R3.5	No change.
CIP-004-5.1 R4	CIP-004-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.
CIP-004-5.1 R4.1	CIP-004-6 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-6 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-6 R4.1.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R4.1.3	CIP-004-6 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-6 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-6 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-6 R4.4	No change.
CIP-004-5.1 R5	CIP-004-6 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R5.1	CIP-004-6 R5.1	No change.
CIP-004-5.1 R5.2	CIP-004-6 R5.2	No change.

CIP-004-5.1 R5.5	CIP-004-6 R5.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1	CIP-006-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R1.1	CIP-006-6 R1.1	No change.
CIP-006-5 R1.2	CIP-006-6 R1.2	No change.
CIP-006-5 R1.3	CIP-006-6 R1.3	No change.
CIP-006-5 R1.4	CIP-006-6 R1.4	No change.
CIP-006-5 R1.5	CIP-006-6 R1.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1.6	CIP-006-6 R1.6	No change.
CIP-006-5 R1.7	CIP-006-6 R1.7	No change.
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.

CIP-010-1 R3.4	CIP-010-2 R3.4	No change.
NEW	CIP-010-2 R4	To respond to the FERC Order No. 791 directive to address transient devices, the SDT modified its approach to use Attachment 1 instead of the table approach. It modified Requirement R4 to "implement one or more documented plan(s) for Transient Cyber Asset and Removable Media ~~plan(s)~~ that include the applicable elements in Attachment 1, except under CIP Exceptional Circumstances."~~new the revised Requirement R4 from the last posting follows a similar approach to the proposed CIP-003-6 attachment. follows the table format to ensure Registered Entities implemented one or more documented process(es) that collectively include each of the applicable parts in CIP-010-2 Table R4 – Transient Cyber Asset & Removable Media Protection.~~ ~~All of the new Requirement Parts under Requirement R4 are in response to this directive.~~
NEW	CIP-010-2, Attachment 1	CIP-010-2 Attachment 1 lists the elements required for Transient Cyber Asset and Removable Media Plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the risks posed by transient devices.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
~~NEW~~	~~CIP-010-2 R4.1~~	~~Part 4.1 ensures Responsible Entities authorize the usage of Transient Cyber Assets prior to initial use, except for CIP Exceptional Circumstances. The authorization shall include the Requirement Parts 4.1.1 through 4.1.4.~~
~~NEW~~	~~CIP-010-2 R4.1.1~~	~~Authorization shall include users, individually or by group/role.~~
~~NEW~~	~~CIP-010-2 R4.1.2~~	~~Authorization shall include locations, individually or by group/role.~~
~~NEW~~	~~CIP-010-2 R4.1.3~~	~~Authorization shall include defined acceptable use.~~
~~NEW~~	~~CIP-010-2 R4.1.4~~	~~Authorization shall include operating system, firmware, and intentionally installed software on Transient Cyber Assets (per Cyber Asset capability).~~
~~NEW~~	~~CIP-010-2 R4.2~~	~~Part 4.2 ensures Responsible Entities use method(s) to deter, detect, or prevent malicious code introduction on Transient Cyber Assets (per Cyber Asset capability).~~
	~~CIP-010-2 R4.3~~	~~Part 4.3 ensures Responsible Entities use method(s) to detect malicious code on Removable Media prior to use on applicable systems.~~
~~NEW~~	~~CIP-010-2 R4.4~~	~~Part 4.4 ensures Responsible Entities mitigate the threat of detected malicious code for Transient Cyber Assets and Removable Media.~~
~~NEW~~	~~CIP-010-2 R4.5~~	~~Part 4.5 ensures Responsible Entities update signatures or patterns for those methods identified in Parts 4.2 and 4.3 that use signatures or patterns.~~
~~NEW~~	~~CIP-010-2 R4.6~~	~~Part 4.6 ensures Responsible Entities evaluate Transient Cyber Assets prior to use for modifications that deviate from Part 4.1.4.~~
~~NEW~~	~~CIP-010-2 R4.7~~	~~Part 4.7 ensures Responsible Entities evaluate Transient Cyber Assets periodically to ensure security patches are up-to-date.~~

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-2 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standards Announcement Reminder

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Additional Ballots Now Open through October 17, 2014

Now Available

Additional ballots for the standards, definitions, implementation plans for **Critical Infrastructure Protection Standards Version 5 Revisions** and non-binding polls of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern on Friday, October 17, 2014.**

The open ballots are as follows:

- Project 2014-02 CIP-003-6
- Project 2014-02 CIP-010-2
- Project 2014-02 CIP Version X*
- Project 2014-02 Definition CIP-003-6
- Project 2014-02 Definition CIP-010-2
- Project 2014-02 CIP Implementation Plan*
- 7 Non-Binding Polls of the associated VRFs and VSLs

*Please note that the Project 2014-02 CIP Version X ballot includes the Version X Reliability Standards and Version X Implementation Plan whereas the Project 2014-02 Implementation Plan ballot includes the Implementation Plan posted for CIP-003-6 and CIP-010-2.

Background information for this project can be found on the project page.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standards, definitions, implementation plans and associated VRFs and VSLs by clicking here.

Note: If a member cast a vote in the initial ballot, that vote will not carry over to the additional ballot. It is the responsibility of the registered voter in the ballot pool to cast a vote again in the additional ballot. To ensure a quorum is reached, if you do not want to vote affirmative or negative, please cast an abstention.

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards and post them for an additional ballot. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot**.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

If you have questions please contact Ryan Stewart or Marisa Hecht.

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Formal Comment Period Now Open through October 17, 2014

Now Available

A 45-day formal comment period for **Critical Infrastructure Protection Standards Version 5 Revisions** is open through **8 p.m. Eastern on Friday, October 17, 2014.**

Background information for this project can be found on the project page.

Instructions for Commenting

Please use the electronic form to submit comments on the standards. If you experience any difficulties in using the electronic form, please contact Wendy Muller. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

Additional ballots for the standards, definitions and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 8-17, 2014.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

If you have questions please contact Ryan Stewart or Marisa Hecht.

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Additional Ballot and Non-Binding Poll Results

Now Available

Additional ballots for CIP Version X, CIP-003-6, CIP-010-2 - **Critical Infrastructure Protection Version 5 Revisions**, two definitions, one implementation plan, and seven non-binding polls of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern, Friday, October 17, 2014**.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

Ballot	Quorum /Approval
CIP Version X	84.63% / 93.21%
CIP-003-6	84.15% / 68.09%
CIP-010-2	84.15% / 74.25%
Definition CIP-003-6	83.90% / 79.91%
Definition CIP-010-2	83.41% / 85.68%
Implementation Plan	83.66% / 89.01%

Non-Binding Poll	Quorum/Supportive Opinions
CIP-003-X	83.96% / 91.79%
CIP-003-6	84.49% / 81.34%
CIP-004-X	83.96% / 96.63%
CIP-007-X	83.96% / 96.63%
CIP-010-X	84.22% / 95.52%
CIP-010-2	84.49% / 85.93%

Non-Binding Poll	Quorum/Supportive Opinions
CIP-011-X	84.22% / 98.13%

Background information for this project can be found on the project page.

Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standards and post them for an additional ballot. If the comments do not show the need for significant revisions, the standards will proceed to a final ballot.

Non-Binding Poll Results

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-02 CIP-003-6
Poll Period:	10/8/2014 - 10/17/2014
Total # Opinions:	316
Total Ballot Pool:	374
Summary Results:	84.49% of those who registered to participate provided an opinion or an abstention; 81.34% of those who provided an opinion indicated support for the VRFs and VSLs

Non-Binding Poll Results

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Non-Binding Poll Results	
Non-Binding Poll Name:	Project 2014-02 CIP-004-X
Poll Period:	10/8/2014 - 10/17/2014
Total # Opinions:	314
Total Ballot Pool:	374
Summary Results:	83.96% of those who registered to participate provided an opinion or an abstention; 96.63% of those who provided an opinion indicated support for the VRFs and VSLs

1. CIP-003-6 R2 - The Registered Entity (RE) appreciates the work of the SDT; however, the RE objects to the requirement in CIP-003-6 to develop cyber security plans for Low Impact assets. Creation of cyber security plans for Low Impact assets adds nothing in terms of increased reliability and should therefore be eliminated. The SDT should consider incorporating the policy requirements applicable to Low Impact assets into the appropriate existing standards. Any requirements associated with cyber security awareness for Low Impact systems should be written into CIP-004. Any physical access control requirements for Low Impact systems should be written into CIP-006. Any electronic access control requirements for Low Impact systems should be written in CIP-005. Any Cyber Security Incident Response requirements for Low Impact systems should be incorporated into CIP-008. Moving the required policy into the appropriate standard more effectively addresses the directive to address Low Impact assets. Placing security controls for remote access, physical security, incident response, and cyber security awareness into a standard governing security management is both confusing and

inconsistent with the existing standards framework. 2. CIP-003-6 R2 VSL - The SDT should consider the VSL associated with CIP-003 R1 and R2 in context. Failure to document or implement a security plan for a Low Impact system inherently poses less risk than for Medium or High Impact systems, yet the VSL rating for both is Severe. The VSL for Low Impact systems should be lower than for High or Medium Impact systems. 3. CIP-003-6 Attachment 1 - The requirements in the security plan belong in the requirements section of the standard, not as an attachment, as noted in comment #1 above. Element 2 addresses physical access controls for the Low Impact BES Cyber System Electronic Access Point (LEAP). LEAPs are not required to be established until September 1, 2018 per Element 3. As written, however, the requirement to physically protect LEAPs would begin five months before they are established. Element 3.1 , Electronic Access Controls states: “For any Low Impact External Routable Connectivity, establish a Low Impact BES Cyber System Electronic Access Point that permits only necessary inbound and outbound access and denies all other access.” The RE is concerned that without specific language to clarify or limit the applicable scope, the establishment of a LEAP would assume the establishment of an ESP, which may inappropriately subject those systems to CIP-005-6 R1. Similarly, establishing controls to permit “only necessary inbound and outbound access and denies all other access” may inappropriately bring CIP-007-6 R1 in to scope. Attachment 2 of Element 3 states that documentation may include “inbound and outbound connections (e.g. IP addresses, ports, services) for any Low Impact BES Cyber System Electronic Access Point are confined to only those the Responsible Entity deems necessary”. This is essentially a restatement of the “Measures” in CIP-007-X R1, which implies this requirement is in scope as well. The RE suggests the SDT revise the Attachment 1 and Attachment 2 language to clearly delineate the respective scope for Low Impact systems versus Medium and High Impact systems. 4. CIP-003-6 Attachment 2 - Attachment 2 does not offer much clarity beyond what is already documented in Attachment 1. The RE suggests that example evidence be documented in a table format similar to that used in CIP-004 -CIP-011 and provide supplemental guidance regarding the type(s) of evidence that would document compliance with the standard. 5. CIP-003-6 Guidelines and Technical basis - The guidance for R2 states “Using the list of assets from CIP-002, the intent of the requirement is for each Responsible Entity to create, document, and implement one or more cyber security plan(s) that address the protections of all low impact BES Cyber Systems.” This guidance is in direct contradiction with CIP-002-5 R1.3 which states a discrete list of Low Impact BES Cyber Systems is not required. The SDT should consider whether a Low Impact system list should be generated as a result of the requirements in CIP-002-5, or revise the guidance in CIP-003-6 R2 to remove language that is contingent upon a Low Impact system list.
No
1. Low Impact External Routable Connectivity (LERC) Definition - Because LERC is communication between Low Impact BES Cyber Systems and Cyber Assets outside the asset, it would not include communication that is routed through a non-BES Cyber Asset such as a historian or jump host located in a DMZ. In those cases, a BES Cyber System would not be communicating outside the asset. The RE suggests the SDT clarify that the intent is to exclude this type of communication. 2. Low Impact BES Cyber System Electronic Access Point (LEAP)

Definition - The term “allows” in the definition is too broad and could inappropriately include assets such as switches, hubs, or other transport devices. The RE suggests using the term “controls” or “restricts” instead.
No
1. Guidelines and Technical Basis - Requirement 4 Attachment 1 Removable Media Page 43 states the following: “Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004.” The statement that “…user(s) must have authorized electronic access to the applicable system…” is not a CIP requirement and should not be included in the Guidelines and Technical Basis section of the document. Additionally, it is not necessary that a user of an authorized removable media device have electronic access to the applicable system. An individual with physical access to a system could be connecting removable media for someone with electronic access but working remotely. 2. CIP-010-6 R4 and Attachment 1 - The required elements and R4 refer to “documented plan(s) for Transient Cyber Assets and Removable Media”. Neither requirement 4, the three pages of Attachment 1 “Required Elements for Plans”, Attachment 2, nor the CIP-010-2 Definitions include a clear definition for what constitutes a “plan”. Certain sections indicate that policies could suffice, but in other sections it only requires “documentation” and seems to purposefully leave out “policies”. The language as written may intend to allow entities flexibility for how a “plan” is documented, but may have the unintended consequence of deferring to the judgment of the auditor to determine what level of “documentation” constitutes a “plan”. The RE suggests the SDT clarify the requirement that a ”plan” can be any type of documentation defined by the RE that meets the “Required Elements for Plans for Transient Cyber Assets and Removable Media” in Attachment 1.

Request clarification on where the dividing line is between Element 4 (Cyber Security Incident Response) and EOP-004. The Element references in Attachment 2 should match the Elements in Attachment 1, otherwise industry could draw incorrect conclusions. Recommend adding

“As needed” to the beginning of Attachment 1 4.7 because not every incident/test needs an updated Incident Response Plan.
No
Recommend removal of “and controls” from the Technical Guidance on Low Impact Cyber System Electronic Access Point (LEAP) to be consistent with the Definition of LEAP. Currently, the LEAP Technical Guidance says “is the interface on a Cyber Asset that allows and controls the LERC,” while the LEAP Definition says “A Cyber Asset interface that allows the Low Impact External Routable Connectivity.”
No
For clarity, suggest revising Attachment 1 2.1 from “each Responsible Entity shall use one or a combination of the following methods: ” to “each Responsible Entity shall use at least one or a combination of the following methods: ” For clarity, suggest revising Attachment 1 2.2 from “each Responsible Entity shall use one or a combination of the following methods:” to “each Responsible Entity shall use at least one or a combination of the following methods:” As written, Attachment 2.3 requires each Entity to review each vendor’s policies/procedures. This may be too burdensome for the industry. Suggest a different solution is needed. Recommend changing from “Responsible Entities shall determine whether additional mitigation actions are necessary ” to “Responsible Entities may determine whether additional mitigation actions are necessary ” Attachment 1 1.2 covers Transient Cyber Asset authorization, however there is no corresponding part for vendor/contractor authorization. Suggest adding a part for Responsible Entity authorization of vendor/contractor use of Transient Cyber Assets.
No
Based on the new definitions, it is unclear on whether a cyber asset can be classified as multiple asset types and would therefore be subject to multiple levels of requirements, i.e. a BES Cyber Asset or a Protected Cyber Asset can also be a Transient Cyber Asset. If a BES Cyber Asset or a PCA also meets the definition of Transient Cyber Asset, there is nothing in the language that says one classification supersedes or precludes another. Solely based on the definitions, it would appear that an entity would have to classify an asset by all the definitions that apply. Recommendations: • Add the following sentence to definition of Transient Cyber Asset: "A Cyber Asset that meets the definition of BES Cyber Asset shall not be considered a Transient Cyber Asset." • Add a minimum requirement to the PCA definition. “If a PCA is connected for less than 30 days then it is a TCA and more than 30 days it is a PCA.”
Yes
Yes
Yes
To avoid industry confusion, recommend changing “elements” to another label such as “plan elements” or “items.” Recommend quality assurance review before future postings, to avoid reviewers’ confusion or need to decipher how to connect related information.

Agree
CSU agrees with the changes to CIP-003-6, R2 including the use of Attachment. CSU recommends the following edit to Attachment 1: “Each Responsible Entity shall reinforce, at least once every 15 calendar months” This establishes that the obligation of security awareness just needs to occur at least once over a 15 calendar month cycle.
Yes
CSU supports the new definitions for Low Impact External Routable Connectivity and Low Impact BES Cyber Systems Electronic Access Point.
Yes
CSU agrees and supports the changes that were made to CIP-010-2, R4.
Yes
CSU agrees with the changes that were made by the SDT to both Transient Cyber Assets and Removable Media definitions. Since “Media” is itself not a defined term, CSU recommends either defining “Media” or not capitalizing the term.
Yes
CSU agrees and supports the proposed implementation plan deadlines for CIP-003-6, R2.
Yes
CSU supports the removal of the IAC language from the 17 requirements based on the FERC directive.

The LERC definition requires clarification as to the external connectivity that is the focus of the definition. Suggest that "outside the network" replace "outside the asset." The definition should read: Low Impact External Routable Connectivity (LERC): Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the network containing those low impact BES Cyber System(s). Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from assets containing low impact BES Cyber Systems are excluded (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).

Yes
No
It remains unclear as to whether a Transient Cyber Asset can also be considered as a BES Cyber Asset. If the intent is to exclude Transient Cyber Assets from the classification of BES Cyber Assets, the definition of Transient Cyber Asset should expressly state, "Transient Cyber Asset: A Cyber Asset, (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes. A Cyber Asset meeting the definition of a Transient Cyber Asset may be excluded from classification as a BES Cyber Asset."

The definition of BES Cyber Asset has been modified to remove the exclusion of Transient Cyber Assets. This creates confusion as to whether a Transient Cyber Asset may still be considered a BES Cyber Asset since the definition of Transient Cyber Asset does not indicate whether a Transient Cyber Asset may be excluded from the classification of a BES Cyber Asset.

We recommend the revisions below to improve or clarify the current draft language. 1) Attachment 1, Element 2 – Recommend removal of “Based on need” qualifier that renders requirement to “restrict physical access” more stringent that comparable requirement for Medium Impact BES Cyber Systems without External Routable Connectivity (CIP-006 R1.1). Also recommend removal of “based on need” language in corresponding Attachment 2, Element 2, Item 2. 2) Attachment 2, Element 4 – The requirements include identification, classification and response in 4.1 and incident handling in 4.4. There appears to be an overlap and redundancy with these terms. Recommend revision to 4.1 to “Identification and response to …”. 3) Attachment 1, Element 4.7 – The current language unconditionally mandates the updating of the incident response plan regardless of need. Recommend revision to: "Updating the Cyber Security Incident response plan, if necessary as determined by the Responsible Entity, within 180 calendar days after completion of a Cyber Security Incident response plan(s) test or actual Reportable Cyber Security Incident. If no updates are deemed necessary, this decision should be recorded within 180 days." Also recommend revision of language in

corresponding Attachment 2, Element 4, last paragraph. 4) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – The last sentence discussing LERC is not clear. Recommend revision to The SDT intends that IED to IED communications be exempt from any requirement to use an electronic access point, even if there is Low Impact External Routable Connectivity. Through this exemption, the SDT intends to not preclude the use of time-sensitive reliability enhancing data exchanges." 5) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – In language describing LEAP, recommend replacing "internal interface" with "an interface" and dropping the "facing the low impact BES Cyber System" language. Well-intentioned but may confuse implementers 6) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – Sentence "However the LERC between assets,… must also pass through the single LEAP" should be revised to say, "…must also pass through a LEAP." 7) Guidelines and Technical Basis, Discussion of R2, Attachment 1, LEAP discussion – Delete "physically" from "unidirectional gateway that physically enforces outbound-only data flows". Change "LEAP are not to be considered EACMS…" to "A LEAP is not to be considered an EACMS…". Change "However they are required" to "However it is required". Delete last sentence ("It is also not the intent of the SDT…" or change to: "A LEAP is not required for any BES Asset where there are low impact BES Cyber Systems but no LERC". 8) Guidelines and Technical Basis, Discussion of R2, Attachment 1, Electronic Access Controls discussion – Within the first main section on page 34 beginning with "The electronic access controls…", recommend replacing "shall" with "should" in the second sentence. This would be more appropriate language for guidance. 9) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – in the diagram for Reference Model 2, change "an LEAP" to "a LEAP". 10) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – Cyber Security Incident Response, first paragraph – "For assets that do not have LERC…" raises the question of whether the assets that do have LERC should have "real time monitoring." There is no monitoring requirement in R2 so this sentence should be deleted. 11) Guidelines and Technical Basis, Discussion of R2, Attachment 1 – Cyber Security Incident Response, second paragraph – per previous comments update to plan(s) within 180 days of a test or an actual incident should only be required if the Responsible Entity determines revisions to the plan are necessary.

Yes

Yes

We recommend the revisions below to improve or clarify the current draft language. 1) Attachment 1, Element 1.3 – "Live operating system and software executable only from read-only media" is not sufficiently clear. Suggested revision: "Use of operating system software and other required executables installed from read-only media." 2) Attachment 1, Element 1.4 – Suggest revision of element title to "Malicious code prevention or mitigation" AND begin first sentence with "To prevent or, if necessary, mitigate the introduction of malicious code,…" 3) Attachment 1, Element 1.5 – Suggested revision of element title to "Unauthorized use prevention or mitigation" AND begin first sentence with "To prevent or, if necessary, mitigate the impact of unauthorized use,…" 4) Attachment 1, Element 2.2 – Suggested revision of "…live operating system and software executable only from read-only media" to "…operating system software and other required executables installed from read-only media"

to add clarity. 5) Attachment 2, Evidence for Element 1.3, 1.4, 1.5, 2.1, 2.2 – Suggest deletion of last sentence in each of these statements as the current language introduces a loophole. The requirements in Attachment 1 are written to provide flexibility to "do A, or B, or C, or something else to mitigate risks" so there should be no circumstance under which an entity can assert it is not possible to do anything to mitigate the security risks. 6) Guidelines and Technical Basis, Discussion of Element 1.4 and 3.2 – The last sentence should be deleted. The statement "Entities should also consider whether the detected malicious code is a Cyber Security Incident" suggests a requirement that is not included in any "R" statement in the draft language. 7) Guidelines and Technical Basis, Discussion of Element 1.5, first bullet – Suggested revision of "…Physical Security Perimeter or other physical location that manages unauthorized physical access…" to "…Physical Security Perimeter or other physical location that manages physical access…". 8) Guidelines and Technical Basis, Discussion of Element 1.5, second bullet – Disk encryption will not protect a Transient Cyber Asset from unauthorized physical access. Suggested revision: "Full disk encryption with authentication is an option that can be used to mitigate the risks associated with unauthorized physical access to a Transient Cyber Asset."

For physical access controls, the draft reads that physical access be restricted 2 ways (1) the asset or location..... and (2) the Low EAP. I don't understand why it has to be both. Suggest changing the "and" to an "or". Also, if (2) is required, that would seemingly require an asset inventory list which is not required for Low impact assets.

The main issue is with section 3 of Attachment 1. There has been no good explanation given for how this requirement will be audited without providing a list of Low Impact BES Cyber Systems which contradicts the wording of CIP-002. Additionally, the “Rationale for Requirement R2” states that "there continues to be no compliance expectation for Responsible Entities to maintain a list(s) of individual low impact BES Cyber Systems." Yet the entities are to identify (without maintaining a list) all of the Low Impact Cyber Systems that require these electronic access controls. It seems that the v5 standards need to settle into some level of stability and then address further security concerns such as the ones addressed in section 3 of the Attachment 1 in a later version or at the very least revise the wording to be more clear with what will be required, how it will be approached, and how it will not be in conflict with other CIP standards.

Attachment 1, Element 4.7 - CenterPoint Energy agrees with EEI's comment. Element 4.7 implies that the Cyber Security Incident response plan should be updated within 180 calendar days after completion of a Cyber Security Incident response plan(s) or actual Reportable Cyber Security Incident. However, this may not always be the case. CenterPoint Energy recommends adding the words ", if needed" after "180 calendar days."
No
CenterPoint Energy generally agrees with requirement R4 and the documentation of a plan to address Transient Cyber Assets and Removable Media. As written in the Guidelines and Technical Basis for R4 Attachment 1, Elements 2.1, 2.2, and 2.3, the requirement allows entities the ability to review the assets to the best of their capability and meet their obligations. Additionally, entities are to document and implement their procedures to mitigate security vulnerabilities and malicious code. In Attachment 1 under Element 2.3, CenterPoint Energy believes that the Responsible Entity should determine the frequency of mitigation actions for Transient Cyber Assets owned or managed by vendors or contractors as noted in the documented plan required in R4. As it is currently written, it can be interpreted as requiring Responsible Entities to perform mitigation methods stated in Elements 2.1, 2.2, and 2.3 each time the vendor or contractor-owned device is connected to a BES Cyber System. This would be operationally inefficient if the vendor is connecting to multiple BES Cyber Systems consecutively within the trusted environment. For example, if a vendor is updating firmware at multiple substations, the Responsible Entity may scan/review the vendor-owned Transient Cyber Asset for security patches and antivirus once, prior to connecting to the first BES Cyber System. The review would be valid and effective for the duration of the firmware update at multiple substations as long as the Transient Cyber Asset is not connected to an unsafe/untrusted environment and is used within the protected environment. CenterPoint Energy recommends adding clarification to the Guidelines and Technical Basis under "Requirement 4 Attachment 1 Transient Cyber Asset(s) Owned or Managed by Vendors or Contractors" for Elements 2.1, 2.2, and 2.3. CenterPoint Energy suggests the following wording to be added to Elements 2.1, 2.2, and 2.3, "prior to connecting their devices to the applicable systems within the trusted environment." Attachment 1, Element 3.2 - CenterPoint Energy agrees with EEI's comment. This requirement is too restrictive and does not mitigate risks. Capabilities exist for embedded, real-time virus scanning and encryption on USB drives, but Element 3.2 does not allow for these options. Also, Element 3.2 does not require the Responsible Entity to take any action other than scanning Removable Media at some point in time. CenterPoint Energy recommends changing "scan Removable Media outside of the BES Cyber System" to "use a method to scan

Removable Media for malicious code and a procedure to respond to detected malicious code.”

1. The R2 Attachment 1 Element 2 and Attachment 2 Element 2 Part 2 that describe authorization “based on need” for physical security controls is problematic and should be removed. The concept appears to be the same as used in CIP-004 R4.1 where you should have some justification of the business need for authorization of electronic and unescorted physical

access and access to BES Cyber System Information, the SDT used it in a different context in CIP-003-6. However, the guidance states, “The requirement does not imply that a specific business need must be documented for each access or authorization of a user for access. The SDT intent is that this need at the higher level be documented such that the requirement cannot be interpreted to mean that any and all access must be restricted. The requirement does not imply that a specific business need must be documented for each access or authorization of a user for access.” A policy level document that requires no action is merely an administrative burden that doesn’t meet the minimum elements of a properly developed Standard. The clause “based on need as determined by the Responsible Entity” should be removed from [Element] 2. Physical access controls in CIP-003-6 – Attachment 1, and item 2 of Element 2 in CIP-003-6 – Attachment 2 should also be removed. 2. The guidance associated with R2 (page 31 of 37 in the clean version) states, “The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do meet the definition of having a 15-minute adverse impact so some protections are needed.” This guidance is should be reworded for clarity as follows: “The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they dostill meet the definition of having a 15-minute adverse impact so some protections are needed.” As stated, the wording creates confusion between “low impact” and “no impact”. 3. The guidance associated with R2 Attachment 1 (page 33 of 37 in the clean version) states “Low Impact BES Cyber System Electronic Access Point (LEAP) – is the interface on a Cyber Asset that allows and controls the LERC.” This language doesn’t match the definition. The sentence should be changed to, “Low Impact BES Cyber System Electronic Access Point (LEAP) – A Cyber Asset interface that allows Low Impact External Routable Connectivity.” 4. Element references in Attachment 2 should match the Elements in Attachment 1, otherwise industry could draw incorrect conclusions. 5. By not placing like requirements throughout the standards, there’s an opportunity to violate more than one requirement. For example, with Cyber Security Awareness and Incident Response, if a facility has all impact levels and a Cyber Security Incident occurs, there’s the potential to violate both CIP-008-5 and CIP-003-6. 6. Requirement [part, element] 4.7 in CIP-003-6 – Attachment 1 assumes that the incident response plan will require an update, which may be an incorrect assumption. The phrase, “as required” should be appended to 4.7. 7. CIP-003-6 Requirement R1, Part 1.2, Subpart 1.2.2 “Physical security controls” is inconsistent with Attachment 1, which uses “Physical access controls.” Recommendation: Change Subpart 1.2.2 to “Physical access controls.” 8. CIP-003-6 Attachment 1, Element 4.7 assumes the response plan will need updates, which may not always be the case. Recommendation: Add “, if needed,” after “180 calendar days.” 9. CIP-003-6 Attachment 2 and Guidelines and Technical Basis for element 2: Attachment 2 (examples of evidence) for element 2 provides card key and special locks as examples of access controls; however, the Guidelines and Technical Basis for element 2 states “entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control.” These inconsistencies make the language of the standard in Attachment 1 vague and unclear. Recommendation: Include “perimeter controls” under element 2, Attachment 2 in the example: “(e.g., card key, special locks, perimeter controls).
No

1. In the LERC definition, example exclusions are listed. The need for the exclusions provided in the examples is unclear. Recommendation: Clarify in the Guidelines and Technical Basis for CIP-003-6 that the exclusion is intended to allow for point-to-point communications (e.g., over fiber) to use routable communication protocols for time sensitive protection and/or control functions.
No
1. For clarity, suggest changing 2.1 from “each Responsible Entity shall use one or a combination of the following methods:” to “each Responsible Entity shall use at least one or a combination of the following methods:” 2. For clarity, suggest changing 2.2 from “each Responsible Entity shall use one or a combination of the following methods:” to “each Responsible Entity shall use at least one or a combination of the following methods:” The phrase “(per Transient Cyber Asset capability)” should be added to 1.5 and 2.2 as is insinuated in the guidance (“If a Transient Cyber Asset is unable to perform…”). 3. CIP-010-2 Attachment 1: The use of “Authorized” in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is unnecessary and implies a second step such as approval of who can use the TCA, where, and how, which is unclear – the plan should identify the users, locations, and uses of the TCA. Recommendation: Remove “Authorized” from 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2. 4. CIP-010-2 Requirement R4 ends with “include the elements in Attachment 1”, although the first sentence in Element 1 says “include each of the element provided below” the actual “elements” are not labeled “elements” as in Attachment 2, which references the elements in Attachment 1. Recommendation: Add “Element” before each numbered bullet in Attachment 1, using the same format as Attachment 2 uses.

These commments are copied from an EEI Draft which we support. If EEI has submitted comments than these may be redundant. Thanks
No
Comment 1.1: CIP-003-6 Rationale for Requirement R2: “Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised.” Aggregating low impact BES Cyber Systems across multiple assets does not reflect a true risk-based assessment and therefore this sentence is

not accurate. Recommendation: Delete this sentence. Focuses on Rationale, not requirement Comment 1.2: CIP-003-6 – Attachment 1: The language in Element 1 “using one or a combination of the following” is inconsistent with the Element 2 language “through one or more of the following.” Recommendation: Change the language in Element 1 to “through one or more of the following.” Minor wording issue Comment 1.3: CIP-003-6 – Attachment 1: CIP-003-6 Requirement R1, Part 1.2, Subpart 1.2.2 “Physical security controls” is inconsistent with Attachment 1, which uses “Physical access controls.” Recommendation: Change Attachment 1, Element 2 to “Physical security controls” to be consistent with the language of the standard. Please edit all other references (e.g., CIP-003-6 Attachment 2, Guidelines and Technical Basis, RSAWs) to CIP-003-6 R1 are consistent. Comment 1.4: CIP-003-6 Requirement R2 ends with “include the elements in Attachment 1”, although the first sentence in Element 1 says “include each of the elements provided below” the actual “elements” are not labelled “elements” as in Attachment 2, which references the elements in Attachment 1. Minor format issue. Recommendation: Add “Element” before each numbered bullet in Attachment 1, using the same format as Attachment 2 uses. This would also be helpful for Attachment 1 in CIP-010-2. Comment 1.5: The “(LERC)” and “(LEAP)” acronyms are missing in Element 2, 3, and 3.1, which makes it harder to identify the use defined phrases in these elements. Recommendation: Add the “(LERC)” and “(LEAP)” to elements 2, 3, and 3.1 to make it easier to identify the acronym. Minor format issue Comment 1.6: CIP-003-6 Attachment 1, Element 4.7 assumes the response plan will need updates, which may not always be the case. Recommendation: Add “, if needed,” after “180 calendar days.” Point of clarification; valid Comment 1.7: CIP-003-6 Attachment 2 and Guidelines and Technical Basis for Element 2: Attachment 2 (examples of evidence) for Element 2 provides card key and special locks as examples of access controls; however, the Guidelines and Technical Basis for Element 2 states “entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control.” These inconsistencies make the language of the standard in Attachment 1 vague and unclear. Recommendation: Include “perimeter controls” under Element 2, Attachment 2 in the example: “(e.g., card key, special locks, perimeter controls). Valid inconsistencies; Comment 1.8: CIP-003-6 Guidelines and Technical Basis, Requirement R2 Attachment 1 bold text subtitles on page 32: The subtitles are inconsistent with the element language in Attachment 1. Recommendation: Change the subtitle language to “Requirement R2 Attachment 1 – Cyber Security Awareness” and “Requirement R2 Attachment 1 – Physical Security Controls” (see Comment 1.2 above). Valid point of clarification

No

Comment 2.1: Use of “allows” in the LEAP definition does not allow for the use of an unmanaged hub. An unmanaged hub, which does not support access controls and may be merely acting as a central connecting point, could be considered an interface that “allows” Low Impact External Routable Connectivity and therefore would be improperly characterized as a LEAP. Element 3.1 of Attachment 1 CIP-003-6 requires inbound and outbound access control for LEAPs, which are not supported by unmanaged hubs. Recommendation: Change “allows” to “controls” to allow for the use of unmanaged hubs as appropriate. Please also make sure this is changed in the Guidelines and Technical Basis and anywhere else the LEAP

definition is provided. Valid definition modification Comment 2.2: Because the acronyms LEAP and LERC are used to help simplify the terms defined and used in the standard, it would help to include the acronyms each time the terms are spelled out in full in the definitions and in the standards and related guidance. Recommendation: Insert the acronyms “(LERC)” and “(LEAP)” as they are spelled out in the definitions. Minor format issue Comment 2.3: In the LERC definition, example exclusions are listed. The need for the exclusions provided in the examples is unclear. Recommendation: Change the exclusion sentence to: “Point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions are excluded (example protocols include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).” Alternatively, Cclarify in the Guidelines and Technical Basis for CIP-003-6 that the exclusion is intended to include point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions. Valid point of clarification Comment 2.4: The definition and guidance for LEAP does not clearly explain that the Network Interface Card (NIC) (a port) is the Low Impact BES Cyber System Electronic Access Point (LEAP) rather than the device containing the NIC. Therefore it is possible to have a NIC port inside a High or Medium Impact BES Cyber System Electronic Access Perimeter (ESP) in an Electronic Access Control or Monitoring System (EACMS). The LEAP does not need to be in an EACMS, but it can be. Recommendation: In the Guidelines and Technical Basis for CIP-003-6, where LEAP is described, move the sentence “LEAP are not to be considered EACMS…” to create a second paragraph and add “However a LEAP can be implement within the same cyber asset that is serving the function of EACMS or EAP for a Medium or High BES Cyber System. This is possible because a LEAP is the interface on the controlling cyber asset (e.g., a firewall or router) and not the cyber asset itself.” Valid point of clarification Comment 2.5: LERC definition or CIP-003-6 Guidelines and Technical Basis for Requirement R2 Attachment 1 – Electronic Access Controls: The following scenario is unclear: {Low impact BES Cyber System (e.g., control system) ---- |1| ---- Cyber Asset (e.g., data historian) ---- |2|} ---- Location X Where: {} represents the asset/site boundary, |1| represents a firewall or electronic access point (in this case firewall 1), and ---- represents a bi-directional routable communication Based on the language of the definition and CIP-003-6 it is unclear whether there is a LERC and LEAP in this scenario and if there is LERC, which firewall is the LEAP. The Guidelines and Technical Basis for CIP-003-6 say “the electronic access controls should address the risk of using the asset’s LERC to gain access to the low impact BES Cyber Systems.” However, this scenario would require an adversary to gain access to not one but of two access points, – the firewalls on either side of the Cyber Asset (firewall 2 and then firewall 1) to get access to the low impact BES Cyber System. Whereas, the examples provided all show one access point, the LEAP, which requires controls. Recommendation: Add this scenario to the CIP-003-6 Guidelines and Technical Basis, Responsible Entity to have the flexibility choose the LEAP, either firewall 1 or firewall 2. Valid point of clarification
No
Comment 3.1: CIP-010-2 R4: The placement of “under CIP Exceptional Circumstances,” is awkward. Recommendation: Move “under CIP Exceptional Circumstances” up in the

sentence, such that it reads "…shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s)…" Minor format issue Comment 3.2: CIP-010-2 Attachment 1: The use of "Authorized" in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is redundant and unnecessary because (1) it already appears in the underscored text for 1.2 and 3.1, and 2 it is implied by the language of 1.2 and 1.3. The language of 1.2 and 1.3 requires a Responsible Entity to specify a user, location, and use for each Transient Cyber Asset (or group of) and specify a user and location for each Removable Media, which means an authorization for the Transient Cyber Asset. The redundancy creates uncertainty in the interpretation of the standard. It could be interpreted to imply a second step in addition to the R4 plan. In other words, in addition to the R4 plan for Transient Cyber Assets and Removable Media, which includes the 1.2 and 3.1 authorization elements, the Responsible Entity must also have a separate, formal approval process plan to identify authorized users, authorized locations, and authorized uses for Transient Cyber Assets and a separate formal approval process to identify who is authorized to use and where they are authorized to use Removable Media. We believe the intent of the Standards Drafting Team is that the plan should include authorization, which identifies the users, locations, and uses for each Transient Cyber Asset (or group of) and users and locations for each Removable Media, giving the Responsible Entity flexibility on how they write the plan to address thesee authorization elements. This flexibility will allow the Responsible Entity to either write a plan that specifically defines who is authorized to use the Transient Cyber Asset(s) for which uses and locations or include a separate authorization process, which may include a formal approval process, in the plan that identifies the users, locations, and uses authorized for the Transient Cyber Asset(s). It will also give the Responsible Entity the same flexibility for Removable Media authorizations. This flexibility is particularly needed for Responsible Entities that rely on contractor use of Responsible Entity managed Transient Cyber Assets and Removable Media who have less control over the contractor, i.e., the control is defined by a service agreement or contract. Giving the Responsible Entity flexibility on how to define the authorization process will allow them to align these requirements with their vendor contracts. Recommendation: Remove "Authorized" from 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2. Alternatively, clarify in the Guidelines and Technical Basis under Element 1.2 and 3.1 that the use of "Authorized" in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 does not require a formal approval process for each user, location, and use of the Transient Cyber Asset (or Removable Media), but gives the Responsible Entity the flexibility to develop an authorization plan that either directly defines authorization or requires a specific authorization process. This allows Responsible Entities to align their Transient Cyber Asset and Removable Media authorizations with their vendor contracts for use of Responsible Entity managed Transient Cyber Assets. Valid point of clarification Comment 3.3: CIP-010-2- Attachment 1 Elements 1 and 2 are grouped by whether a Transient Cyber Asset is owned or managed by the Responsible Entity or by a vendor or contractor. The intent of this grouping is good because it considers the level of control by the Responsible Entity. However, the actual groupings could result in a Transient Cyber Asset that falls under both element 1 and 2. For example, if a Responsible Entity owns the Transient Cyber Asset, but a contractor manages its use under a service management contract. Another scenario is that the vendor owns the Transient Cyber Asset, but the Responsible Entity manages it. For

these scenarios, it is unclear whether the Responsible Entity should include element 1 or 2 or both elements in their R4 plan(s). Recommendation: Remove “Owned or” from elements 1 and 2. Comment 3.4: CIP-010-2 - Attachment 1, Element 2.3: “Responsible Entities shall determine whether additional mitigation actions are necessary…” requires a statement that says no additional mitigation measures were identified as necessary, which creates an unnecessary administrative burden. Also, Element 2.3 is an element that should be addressed by the R4 plan for Transient Cyber Assets and Removable Media, the way Element 2.3 is written makes it look like a requirement rather than a plan element, which also causes confusion as to the frequency of review for elements 2.1 and 2.2. Element 2.3 as written suggests that a Responsible Entity must use the 2.3 and 2.4 mitigation methods prior to each connection of a vendor-owned Transient Cyber Asset in order to determine whether additional mitigation measures will be needed. This can be overly burdensome and unnecessary when a vendor is moving from system to system in a single day. Also, a Transient Cyber Asset may be owned by the Responsible Entity and managed by a vendor or owned by the vendor/contractor and managed by the Responsible Entity. The use of “vendor- or contractor-owned” in 2.3 is not consistent with these scenarios (see comment 3.3 above).We recommend restructuring Element 2.3 to make it clear that this – determining whether additional mitigations are needed before the vendor-owned Transient Cyber Asset is connected – is an element of the plan that should be addressed to manage the associated risk and not that elements 2.1, 2.2, and 2.3 need to be used prior to each connection. Recommendation: Change Element 2.3 to:Add “necessary” before “such actions.” Also, clarify in the Guidelines and Technical Basis that the Responsible Entity has flexibility in determining how to manage vulnerability and malicious code reviews of their vendors or contractors and require additional mitigation actions. For example, one entity may require a vendor to plug a Transient Cyber Asset into a kiosk to scan for vulnerabilities and malicious code before each connection. However, this approach may not be feasible for all entities, so defining a process to initially and periodically check and audit vendor/contractor processes for vulnerability and malicious code mitigation. Specifically, “prior to connecting the vendor- or contactor-owned Transient Cyber Asset” does not require that 2.1, 2.2, and 2.3 before each connection, but that the Responsible Entity should define a process to manage the use of vendor- or contractor- managed Transient Cyber Assets to mitigate vulnerabilities and malicious code. Also, change “owned” in 2.3 to “managed.” Comment 3.5: CIP-010-2 – Attachment 2, elements 1.3, 1.4, 1.5, 2.1, 2.2, 2.3, and 3.2: The use of “mitigate” and “mitigation” should be explained to make it clear to auditors that mitigate/mitigation means to reduce risk and does not mean that every vulnerability must be addressed and every piece of malicious code detected and stopped. Recommendation: Make it clear in the Guidelines and Technical Basis that “mitigate” and “mitigation” does not require that every vulnerability is addressed, as many may be unknown or not have an impact on the system that the Transient Cyber Asset or Removabl ???e Media is used on. Also, it may be impossible to detect every piece of malicious code. Mitigation is meant to reduce security risks, but elimination of all risk is impossible. Comment 3.6: CIP-010-2 – Attachment 2, Element 3.2: This requirement is too restrictive and does not mitigate risks. Capabilities exist for embedded, real-time virus scanning and encryption on USB drives, but Element 3.2 prevents their use. Also, 3.2 does not require the

Responsible Entity to take any action other than scanning Removable Media at some point in time. Recommendation: Change “scan Removable Media outside of the BES Cyber System” to “use a method to scan Removable Media for malicious code and a procedure to respond to detected malicious code.” Comment 3.7: CIP-010-2 – Attachment 2, Element 1.2: The second sentence under Element 1.2 is a restatement of Attachment 1, Element 1.2 and is not an example of evidence. Recommendation: Remove the second sentence under Attachment 2, Element 1.2: “The documentation must…” to keep the text in Attachment 2 focused on examples of evidence and not include requirements. Comment 3.8: Guidelines and Technical Basis for R4, Attachment 1, Element 1.1: inventories of Transient Cyber Assets is allowed by individual or group – individually or by asset type, therefore language under Element 1.1 should be consistent, allowing inventory of devices or device type. Recommendation: Add “or device types” to the second sentence: “pre-authorize and inventory of devices or device types or authorize devices or device types at the time of connection or use a combination of these methods.”
No
Comment 4.1: Transient Cyber Asset Definition: The “and” in the parenthesis after “A Cyber Asset,” is confusing. It could be interpreted as meaning a Cyber Asset must use all of these types of communication connections. Also, the parenthetical for the examples is misplaced; it refers to examples of communication types not Cyber Assets. Also, the definition makes it unclear whether a Transient Cyber Asset could also be a BES Cyber Asset or a Protected Cyber Asset and therefore which requirements apply. For example, if a Responsible Entity defines a BES Cyber System to include a device, which could also be considered a Transient Cyber Asset, does the BES Cyber System requirements apply, the Transient Cyber Asset requirements, or both? Finally, “directly connected” may be interpreted as meaning only non-routable communications; however, we believe the intent is to include both routable and non-routable communications. Recommendation: Change the definition for Transient Cyber Asset to: “A Cyber Asset that is not included in a BES Cyber System and is not a Protected Cyber Asset (PCA) and is capable of transmitting executable code that is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth) for 30 consecutive calendar days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.” Also, if the intent is for the Transient Cyber Asset definition to apply to both routable and non-routable communications, clarify this in the Guidelines and Technical Basis for CIP-010-2.
No
Comment 5.1: CIP-003-6, Attachment 1, Element 2 compliance date of April 1, 2018: According to the Implementation Plan, the Element 2 physical access controls must be applied to LEAPs by April 1, 2018; however, the LEAPs are not identified under Element 3, which must be applied by until September 1, 2018. Recommendation: Change the compliance date for Element 2 to September 1, 2018 to allow time for the LEAPs to be identified under Element 3 and the physical access controls to be applied to them under Element 2. Alternatively, leave the compliance date for physical access controls to “the asset or the locations of the low

impact BES Cyber Systems within the asset" as April 1, 2018 and change the compliance date for requiring physical access controls to the LEAPs to September 1, 2018.
No
Comment 6.1: CIP-011-2 R1/CIP-011-X: Information protection item CIP-003-4, R4.3 allowed for annual assessment of adherence to the BES Cyber System information protection program and development of an action plan to remediate any identified deficiencies. This language provides a risk management approach: identifying the information that needs to be protected, implementing procedures to protect that information, and annually assessing adherence to that policy and incorporating lessons learned. Without the R4.3 language, any violation of the procedure will result in a Severe violation of the requirement and under the Violation Severity Level table for R1. Only a Severe level is listed for if plan is not documented or implemented, therefore if the plan is documented and partially implemented (i.e., deficiencies are found), then it is a Severe VSL. Recommendation: Add a part 1.3 to R1 to address this concern: "The Responsible Entity shall, at least annually, assess adherence to its procedures for protecting and securely handling BES Cyber System Information, including identification, protection, and handling; document the assessment results; and implement an action plan to remediate deficiencies identified during the assessment." Adjust the Violation Severity Level table for R1 accordingly. Also, change the language of the existing Severe VSL to tier possible violations into lower levels commensurate with the risk.

We disagree with the revised structure of CIP-003-6. The concept of using tables to articulate the requirements is effective in all other standards and should be equally effective in CIP-003-6. The proposed structure introduces inconsistency of structure which is confusing. Attachments should not be used to articulate requirements. Attachment 1 is a list of requirements and should be treated as such within the main body of the standard. Attachments should only be used for guidance or informational items, not requirements that must be complied with.
No
The definition for LERC states that "Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s)." We suggest that the statement should include both BES Cyber Systems and BES Cyber Assets as LERC should apply to both systems and assets and should read: Bi-directional routable communications between low impact BES Cyber Asset(s)/BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s)/BES Cyber Asset(s).

No
We disagree with the structure approach to address transient cyber assets in a separate requirement as it leads to inconsistent approaches between BES Cyber Systems/Assets and transient assets. We suggest that it would be much simpler and more efffective if transient assets were added to the Applicable Systems column where appropriate throughout the standards. It is not clear why R4 substantially deviates from the table format of the sub-requirements. If it is necessary to have a separate requirement for transient assets we recommend that R4 be revised to reflect the table format of the sub-requirements and not use an attachment. It is not appropriate to put sub-requirements in an attachment, they should reside in the main body of the document along with the requirement wording as is done for all other CIP standards.
No
The definition of Removable Media refers to media that are "capable of transmitting executable code to: ". We suggest that the word "transmitting" is incorrect and should read "transferring". Media such as floppy disks do not transmit but one can transfer executable code from the disk to another media.

Yes
MISO supports the changes made by the SDT to Requirement R4 and Attachment 1. ATTACHMENT 1: The posted language for Attachment 1, Element 2.3 requires, “Responsible Entities shall determine whether additional mitigation measures are necessary…”, intending the entity make an affirmative decision to allow the device to connect. It is recommended revising as, “Responsible Entities shall determine whether any additional mitigation actions are necessary to clarify and entity may allow connection of the device without requiring modifications. GUIDELINES AND TECHNICAL BASIS: The posted language for the Transient Cyber Assets in Attachment 1, Element 1 allows for authorization to be done individually or by asset type; however the Guidelines and Technical Basis for Element 1 does not discuss the ability to authorize based on a group of assets. SMUD recommends language be added to allow “authorization individually or by groups of assets” to the Guidelines and Technical Basis for Element 1.1.

Recommend the requirements for physical security of low assets be deleted. This requirement is repetitive of safety requirements in the National Electrical Safety Code (NESC), Section 11 - Protective arrangements in electric supply stations, paragraph 110 General requirements. The NESC includes requirements to protect the public from high voltages. The safety aspects of the NESC are more stringent than the requirements in the proposed NERC standard and public safety is a higher concern than the less likely occurrence of security concerns at a low impact asset. Specifically the proposed CIP-003-6 requires: Element 2: Examples of evidence for element 2 may include, but are not limited to: 1. Documentation of one or more access controls (e.g. card key, special locks), monitoring controls (e.g. alarm systems, human observation), or other operational, procedural or technical physical security controls to restrict physical access to both: a. The asset, if any, or the locations of the low impact BES Cyber Systems within the asset; and b. The Cyber Asset, if any, containing the Low Impact BES Cyber System Electronic Access Point. 2. Documentation showing that the physical access restrictions cited above are based on need, which may include, but is not limited to, a policy describing the high level operational or business need(s) for physical access. The proposed NERC requirement allows technical physical security controls to restrict physical access to both. A fence with a locked gate, which is required by the NESC appears to meet the proposed NERC requirement to restrict physical access to both the asset and the cyber asset. The other suggestions in the draft standard could be provided in a best practices document. The requirement for physical security of low assets should be deleted.
No
The LERC should specifically exclude communications aided relaying used for pilot relaying protection. Also, there is a high risk of confusion when using technical jargon in NERC definitions. Both of these definitions fall within this high level of confusion. If a national reliability standard requires too much technical jargon, it is written at the wrong level for its purpose. The reliability standard should be written to avoid the use of these definitions.
No

While the language in the proposed requirements is a good practice, it creates significant compliance burden for entities to maintain documentation to prove compliance; plus, additional resources will be required to implement compliance controls that yield minimal risk reduction for the reliability of the BES. Transient devices will be a source of possible violations in future internal compliance reviews for self reports and also compliance audits. Section 1.2 of Attachment 1 is not needed and should be removed. Requirements already exist for anyone having access to protected cyber systems. Section 1.2 puts an entity in double jeopardy of violating multiple requirements for one action. The same comments apply to section 3.1 of attachment 1 and this requirement should be removed.
No
As stated in previous comments, we do not support the removal of the IAC language. Removal of the IAC language is a return to zero tolerance and RAI does not magically make a violation disappear. Our suggestion is to delete any requirement from the standard that contains IAC language. This is our opportunity as an industry to remove the sections, develop better language as FERC allowed, or face multiple violations of these zero tolerance requirements for many years. We've rushed through all the previous versions to meet a deadline. This is the time to work on a solution and get a better standard. We are working to meet compliance deadlines for version five standards while making changes to the standards – this can't be a good practice. FERC approved the version five standards; they didn't remand them back. We have an official compliance date to meet for version five. Worse case, let's use the IAC language as currently approved.
Yes
The NERC CIP standards have resulted in numerous violations to registered entities and have been difficult to implement. These standards must get to a steady state and changes to the standards should be limited to an absolute minimum.

Seattle City Light supports the proposed CIP v5 revisions, but remains concerned about the compliance aspects of providing protections for Low-rated systems and assets. Our primary concern is that in a multi-impact rated program (high, medium and low), any failure to fulfill a requirement such as Attachment 1, Element 1 Cyber Security Awareness or Element 4 Cyber Security Incident Response, could result in violation of CIP-003-6, R2, CIP-004-5, R1 and CIP-008-5, i.e. a single compliance failure could result in multiple violations. NERC recently was queried about this concern, and the response (which follows) was not especially reassuring: "Responsible Entities may choose to implement multi-impact rated programs to address low, medium, and high impact BES Cyber Systems. It is possible the same facts and circumstances

may indicate noncompliance of both the requirements applicable to low impact BES Cyber Systems and the corresponding requirements applicable to high and medium impact BES Cyber Systems. That the same act or omission may result in two separate violations is not unique to the CIP V5 standards. For example, the same failure to act immediately could constitute a violation of both TOP-001-1a R2 and TOP-008-1 R1. NERC's Sanction Guidelines provide that one penalty may be assessed where there are multiple violations arising from a single act or common incidence of noncompliance. Therefore, if a penalty is assessed at all, it would not be duplicated. In addition, the disposition of any noncompliance is based on the level of risk posed to the reliability of the BPS. Therefore, in the event one or more of the instances of noncompliance poses a minimal risk, a number of streamlined options is available, including treatment as a compliance exception. As with any noncompliance, a determination of whether compliance exception treatment will be appropriate in a given case will depend on the facts and circumstances." In particular, the reply by NERC staff cites examples in other Standards where a single omission or failure could violate two or more requirements of different Standards. It is Seattle's understanding, however, that addressing this 'double-standard' redundancy issue throughout the Standards is one of the objectives of the present Standards clean-up effort (as recommended by the Independent Experts report, P81 effort, the ongoing 5-year reviews, and the object of "world class" standards). In particular, the two TOP standards identified by NERC as examples today are being replaced with new TOP versions (in final ballot as this is written) that address this very 'double-standard' issue NERC cites as a 'reason' it's OK to have possible double jeopardy written into CIP v5. It is not OK. It is not world class. Newly written Standards should not include a known deficiency that industry resources now are being used to eliminate in other Standards. That NERC Saction Guidelines address potential aggregation of duplicative violations into a single penalty is welcome, but it treats the symptom of the problem rather than the cause.

The term Bulk Power System in the Rationale for Requirement R2 should be replaced with Bulk Electric System. The requirements outlined in Attachment 1, Element #4 for Low Impact assets are virtually identical to the requirements outlined in CIP-008-5 for High and Medium Impact BES Cyber Systems. While these requirements are appropriate for the High and Medium Impact BES Cyber Systems, they are overly onerous for the Low impact assets as the

requirements are not appropriately scaled to reflect the lower criticality of the assets the requirements are aiming to protect. This is especially true for the Low Impact assets that do not include External Routable Connectivity. These incident response requirements should only be required of High and Medium Impact BES Cyber Systems and therefore removed from Attachment 1, Element #4, or at minimum they should only apply to the Low Impact assets that have External Routable Connectivity. Without External Routable Connectivity, the only compromise to the BES is to the single BES Low Impact asset itself. According to the Rationale for Requirement R2, “these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised”. The Attachment 1 as written does not recognize the lower risk of the Low Impact BES assets.

Yes
Although we agree with the overall approach the Standards Drafting Team has taken, FirstEnergy does support EEIs recommendations for improving the wording of the definitions and related standards language.
No
FirstEnergy does not agree that the CIP Standards adequately specify the scope of devices that can be classified as Transient Cyber Assets. The definitions and standard language make it unclear whether a Transient Cyber Asset needs to be treated as a BES Cyber Asset or a Protected Cyber Asset and therefore which requirements apply. For example, if a Responsible Entity makes a temporary routable connection between a Transient Cyber Asset and an ESP, would this Transient Cyber Asset also have to meet the requirements for the BES Cyber System or for a connected PCA? In other words, could the BES Cyber System requirements also be construed to apply to a Transient Cyber Asset that is temporarily connected? Recommendation: Change the definition for Transient Cyber Asset to: “A Cyber Asset that is capable of transmitting executable code that is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth) for 30 consecutive calendar

days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes. A Transient Cyber Asset is not included in a BES Cyber System and is not a Protected Cyber Asset (PCA)."

Yes
CIP-003-6 R2 Att. 1 Element 2 – Recommend removing "based on need" for two reasons: 1. CIP-006-5 R1.1 – Requires controls to 'restrict' physical access, but it does not require authorizations or "based on need" for medium impact BES Cyber Systems that do not have External Routable Connectivity. This is an example of a requirement that is more prescriptive for low than for mediums because of the additional documentation associated with "based on need". 2. It is unclear how to interpret this part of the requirement due to the placement of the phrase "based on need", particularly with ", if any,". CIP-003-6 R2 Att. 1 Element 4 – Draft 2 added two more parts with 4.6 (record retention) and 4.7 (incident response plan updates.)

Recommend adding “if needed [required]” to 4.7. If the plan is okay, entities should not be required to update it.
Yes
Definitions – Low Impact BES Cyber System Electronic Access Point (LEAP) – Recommend replacing “allows” with “controls” Low Impact External Routable Connectivity (LERC.).
Yes
CIP-010-2 R4 Att. 1 Elements 1.2 and 3.1 – Recommend removing ‘Authorized’ because it adds requiring someone to approve/authorize these items. This additional level of documentation is more burdensome for low impact BES Cyber Systems. Entities would still be required to “specify” users, locations and use (individually or by group) for Element 1.2 and “specify” users and locations (individually or by group) for Element 3.1.
Yes
Yes
Yes
Yes
Implementation plan – Recommend changing the implementation date for physical access controls from April 1, 2018, to Sept. 1, 2018, because physical access controls must be applied to LEAPS, which don’t have to be identified until the electronic access controls implementation date of Sept. 1, 2018. CIP-010-2 Guidelines and Technical Basis Element 1.1 - Insert “type” with references to devices. For example, “…pre-authorize and inventory of devices or device types; or authorize devices or device types at the time….” CIP-011-2(X) R1.2 – Recommend going back to language similar to what was required in CIP-003 versions 3 and 4 R4.3, which stated: “The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.” There was no change from version 3 to version 4. The original version 5 mapping document indicates “no significant changes” when it was moved from CIP-003 to CIP-011 R1.3. However, R1.3 was removed from version 5 when the IAC language was incorporated. Now that IAC has been removed, the V3 text or something close to it should be retained. Possible revision: “The Responsible Entity shall, at least annually, assess adherence to its BES Cyber System Information protection program, including identification, protection and handling; document the assessment results; and implement an action plan to remediate deficiencies identified during the assessment.”

Karin Schweitzer
Texas Reliability Entity
No

1) Rationale for Requirement R1: Texas Reliability Entity, Inc. (Texas RE) recommends replacing “its” with “a Responsible Entity’s” in the second sentence of the first paragraph. The proposed revised language would read as follows: “The purpose of policies is to provide a management and governance foundation for all requirements that apply to a Responsible Entity’s BES Cyber Systems.” 2) Requirement R1.2: Texas RE recommends the following elements be added to the Cyber Security Plan for Low Impact systems to reduce the risk to Medium and High Impact BES Cyber Systems: information protection, recovery functions, system security functions and configuration change management functions. By definition, Low Impact systems are those deemed not as critical to the BES as Medium or High Impact systems. However, in today’s integrated EMS networks, a vulnerability in a Low Impact system is imposed on Medium and High Impact BES Cyber Systems. Therefore the aforementioned items should be included in the Low Impact system Cyber Security Plans.
No
Low Impact BES Cyber System Electronic Access Point (LEAP): Texas RE requests the SDT consider including the functional definition that is already included in CIP-003-6, Attachment 1, Paragraph 3.1 within the proposed definition of a LEAP. In addition, we suggest striking the last sentence of the definition because it appears to be in conflict with the Electronic Access Control or Monitoring Systems (EACMS) definition that becomes effective April 1, 2016. The FERC approved EACMS definition includes all BES Cyber Systems and is not restricted to Medium or High Impact BES Cyber Systems; therefore, the LEAP definition should not exclude Low Impact BES Systems. Texas RE suggests the following change to the definition: “Low Impact BES Cyber System Electronic Access Point (LEAP): A Cyber Asset interface that allows Low Impact External Routable Connectivity and permits only necessary inbound and outbound access and denies all other access.”
No
1) Requirement R4: It appears the SDT may have inadvertently excluded low impact BES Cyber Systems. FERC directed in Order 791, Paragraph 136, that requirements should consider “processes and procedures for connecting transient devices to systems at different security classification levels (i.e. High, Medium, Low Impact).” Texas RE recommends the following revision to Requirement R4: “Each Responsible Entity, for its high impact, medium impact, and low impact BES Cyber Systems and associated Protected Cyber Assets, shall implement one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the elements in Attachment 1, except under CIP Exceptional Circumstances.” 2) Measure 4: Proving compliance may be difficult for a registered entity since there is no requirement to maintain any identification nor connection records that validate whether the device was connected for 30 consecutive days. This could be remedied with the addition of the following language to M4: “including but not limited to a list of in-scope transient devices, and manual or automated logs showing connection periods…” The proposed revised language would read as follows: Evidence shall include each of the documented plan(s) for Transient Cyber Assets and Removable Media that collectively include each of the applicable elements in Attachment 1 and additional evidence, including but not limited to a list of in-scope transient devices, and manual or automated logs showing connection periods to demonstrate implementation of plan(s) for Transient Cyber Assets and Removable Media. Additional

examples of evidence per element are located in Attachment 2. If a Responsible Entity does not use Transient Cyber Asset(s) or Removable Media, examples of evidence include, but are not limited to, a statement, policy, or other document that states the Responsible Entity does not use Transient Cyber Asset(s) or Removable Media.
Yes
No
Texas RE suggests that the proposed implementation time periods are excessive by 12 months, particularly for administrative documentation. Therefore, Texas RE recommends the following changes for implementation for CIP-003-6: CIP-003-6: April 1, 2016 (no change) CIP-003-6, R1, R1.2: April 1, 2016 CIP-003-6, R2: April 1, 2016 CIP-003-6, Attachment 1, Element 1: April 1, 2016 CIP-003-6, Attachment 1, Element 2: April 1, 2017 CIP-003-6, Attachment 1, Element 3: September 1, 2017 CIP-003-6, Attachment 1, Element 4: April 1, 2016

IMPA supports the SMUD comment on Attachment 1: SMUD does suggest an important edit to Attachment 1, Element 1 to clarify the obligation. The posted language requires “Each Responsible Entity shall reinforce, once every 15 calendar months, its cyber security practices, using one or a combination of the following methods:…” Literal reading of this obligation means that entities are required to perform security awareness on a specific 15 month cycle. To align this obligation with that of CIP-004-5, R1, Part 1.1, SMUD requests the following edit: “Each Responsible Entity shall reinforce, AT LEAST ONCE every 15 calendar months, its cyber security practices, using one or a combination of the following methods.” This establishes that the obligation of security awareness just needs to occur at least once over a 15 calendar month cycle.
No
IMPA supports the EEI comments regarding Attachment 2 of CIP-010-2: CIP-010-2 – Attachment 2, elements 1.3, 1.4, 1.5, 2.1, 2.2, 2.3, and 3.2: The use of “mitigate” and “mitigation” should be explained to make it clear to auditors that mitigate/mitigation means to reduce risk and does not mean that every vulnerability must be addressed and every piece of malicious code detected and stopped.
Yes
IMPA supports the removal of the wording and understands that NERC proposes to use the RAI program to keep these 17 requirements from becoming “zero” defect requirements. However, IMPA would like to see the RAI program be approved by the NERC Board and FERC before considering an “affirmative” vote on the CIP standards. In addition, the RSAWs need work with providing clarity and guidance for the compliance expectations of the CIP standards, especially since the IAC wording has been removed.

Additional guidance as to what is 'not' considered a transient device could be beneficial to the industry and would remove any possible confusion or assumptions.
Yes
Yes
We would like the drafting team to consider modifying the implementation dates for electronic access and physical security to be 18 months from the effective date of April 1, 2017. Physical security implementations, depending on the site(s), could have long durations and require additional budget cycles to implement across a diverse geographic and multiple asset types.
Yes
Moving from a zero defect compliance approach to a risk-based compliance is critical to the success of implementing CIP version 5. There has been significant progress made with Reliability Assurance Initiative. If RAI is not fully implemented and well understood by industry well in advance of the effective date of the CIP standards, there will be a significant increase in violations without a commensurate benefit to reliability. We are cautiously optimistic that RAI will be implemented in time for implementation of version 5 of the CIP standards.
Yes
(1) We support the CIP v5 Revisions Standards Drafting Teams' (SDT) efforts in minimizing the impact of Low Impact Facilities implementation by not requiring an asset inventory list,

allowing of grouping of assets for physical security and flexibility of restricting electronic access. (2) Because CIP Version 5 revisions will impact the smaller utilities, cooperatives, load serving entities, and distribution providers significantly, it is beneficial to these entities to approve CIP 5 revisions without further changes (so that they are steady-state) to allow for the impacted entities to plan, budget and implement CIP Version 5. (3) Approval of the changes to Identify, Assess, and Correct language removal, network communications security, Low Impact requirements and Transient Device requirements is recommended by ACES.
Individual
Amy Casuscelli
Xcel Energy
No
Xcel Energy has concerns about the requirements applicable to Low Impact assets. The revised language states that there is no expectation to keep a list of individual low impact BES Cyber Systems and their associated cyber assets or to maintain a list of authorized users. It is unclear how compliance evidence of required electronic access controls per Attachment 1, Element 3 can be shown without such lists. Additionally, this appears to be in contradiction of the FERC directive to fix by adding specific requirements. It would seem the precedent used for Medium Impact without External Routable Connectivity of just documenting operational and procedural controls would be sufficient. This ambiguity in Requirement language is concerning since Xcel Energy will have over 600 low impact substations; an 850% increase in those subject to NERC CIP Compliance with a resulting significant financial impact to implement electronic access controls at these low impact substations. While the proposed standard allows an option or a combination of either access controls, monitoring or defining operational and procedural controls for Low Impact assets, these requirements are still beyond those of Medium Impact Assets without External Routable Connectivity. With these recommendations, it appears that more value is being placed on Low Impact Assets than Medium Impact without External Routable Connectivity so the Medium Impact Medium Impact without External Routable Connectivity language should be modified and/or Low Impact should follow the same requirements as Medium Impact without External Routable Connectivity. However, since Low Impact Assets are by definition those with low risk to the BES, the original Version 5 requirement simply requiring documentation of physical controls would seem sufficient. Given the number of Low Impact Assets, with the requirements in CIP-003-6 Attachment 1, more time will be spent addressing Low Impact facilities and assets than High or Medium. The R2 revision introduces a requirement to have ‘plans’ for each of the four areas for Low Impact systems. Previously the requirement was only to have policies/procedures/controls. This creates an additional administrative burden to bundle the policies/procedures/controls into a ‘plan’ and should be removed. Attachment 1, Element 4.7 assumes the response plan will need updates, which may not always be the case. We recommend the addition of [if needed] after “180 calendar days.” Attachment 2 (examples of evidence) and Guidelines and Technical Bases for element 2 provides card key and special locks as examples of access controls; however, the Guidelines and Technical Basis for element

2 states “entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control.” These inconsistences make the language of the Standard in Attachment 1 vague and unclear. We recommend revising the Guidelines and Technical basis to include all example controls in one reference, and indicate that the minimum requirement for perimeter control shall include fences with locked gates and site access policies only. The language should indicate that additional controls, such as CCTV, card key access and special locks may be used as desired but exceeded the minimum requirement. In the Guidelines and Technical basis section the SDT uses the Version 3 term, special locks but outside of what is in the standard, does not define this term. Is a propriety key considered a special lock or what is the definition of “restricted keyway”?
No
The definitions for both LEAP and LERC are not clear. The LEAP definition would suggest that a logical network extends beyond a physical boundary, as the LEAP does not necessarily have to reside at the same location as the low-impact BES Cyber Systems. If the LEAP is not an EACMS, then what control is being applied to this asset classification? The definition for LERC is also unclear. The phrase “Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s).” is unclear if it is referring to access to/from a system or network.
Yes
Yes
No
We do not support the revised language providing for tiered deadlines for low impact assets.
Yes
One of the greatest advantages of the IAC language was to allow the industry to focus on security and move away from administrative burden of no to minimal risk issues. The idea of Internal Controls and RAI seems to be a good alternative, but has yet to be fully defined, leaving more burden on the industry, the regions and NERC to document and enforce minimal issues under the FFT program.

The revised language in CIP-010-2, Requirement 4 is unclear with respect to "under CIP Exceptional Circumstances." We would recommend revising the language to state: "Each Responsible Entity, for its high impact and medium impact BES Cyber Systems and associated Protected Cyber Assets, shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s) for Transient Cyber Assets and Removable Media that include the elements in Attachment 1." We believe that this clarifies the language of this requirement. Additionally, SCE would suggest that Elements 1 and 2 of Attachment 1 be revised to clarify the levels of review required based on the control exercised by a Responsible Entity over a Transient Cyber Asset (TCA). The language should be revised to describe the requirements when an entity has "full" or "substantial" control through its ownership and management of the asset, as compared when an entity has "minimal" control, as seen when leasing an asset from a vendor. We think that this clarification would aid entities in ensuring compliance with CIP-010-2.

Exelon Companies
No
Exelon supports the revised structure of CIP-003 and the extensive revisions made to the requirement language. Below are comments for SDT consideration. Exelon voted negative on CIP-003, though it feels the standard is very close to acceptable. While most of the comments point to refinements in the language rather than “deal breaker” concerns, the length of the list suggested that the standard is not yet ready for final approval. Exelon called out the most concerning issues below and feels that addressing all the points below will provide greater clarity for entities when the standard is implemented and audited. General Concerns 1.

Potential for Multiple violations: Exelon supports the use of CIP-003 for the requirements applicable to lows and appreciates the revised language that allows entities with multiple impact levels the option to incorporate low into related programs applicable to highs and mediums. This flexibility is important to accommodate the diverse circumstances that exist across the industry. However, Exelon has some concern that in a multi-impact rated program (high, medium and low), any failure to fulfill a requirement such as Attachment 1, Element 1 Cyber Security Awareness or Element 4 Cyber Security Incident Response, could result in violation of CIP-003-6, R2, CIP-004-5, R1 and CIP-008-5. Potential compliance and enforcement implications should not dictate the structure of the standards nor an entity's compliance program. An entity should be allowed to determine, in a form most efficient and effective to the entity, the best approach in fulfilling the security requirements. Please offer reassurance that the currently proposed structure with CIP-003-6, R2 does not create a potential situation for multiple violations. Confirmation from NERC Compliance will be important. This is a key concern that influenced a negative vote. 2.CIP-003-6, R2. Please directly discuss in the Guidelines the relevance of the "Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required." This note was important in the approval of V5 and Exelon supports inclusion of this note to help limit focus on a list of devices rather than emphasizing protections. However, many struggle to understand how to demonstrate compliance without having a list. Please discuss any potential alternatives to a list. As well, since the note does not preclude using a list if an entity determines this to be a desired tool to demonstrate compliance, please confirm that violations are not to accrue to the list, but only to failures to implement the plan Attachment 1 1.Element 1: To be consistent with CIP-004-5 and to match the discussion in the Guidelines, Element 1 should remove the word "its" to read: "Cyber security awareness: Each Responsible Entity shall reinforce, once every 15 calendar months, cyber security practices, using one or a combination of the following methods: …" 1a -The inclusion of "its" reads that the awareness program is to discuss the cyber security practices of the entity rather than the more general wording of CIP-004-5, R 1.1: "… reinforces cyber security practices (which may include associated physical security practices) …" Furthermore, addition of the parenthetical would be helpful to clarify that physical security practices are acceptable awareness topics under this requirement. These two adjustments are important to entities with multiple impact level BES Cyber Systems that may want to apply a single program to apply to high, medium and low impact levels. 1b - As well, the adjustment is needed to be consistent with the Guideline language: "The intent of the security awareness program is for entities to reinforce good cyber security practices … The intent is to cover topics concerning any aspect of the protection of BES Cyber Systems." As stated, the intent does not limit the awareness topics to only those associated with internal cyber security policies and practices. 1c - This revision is important to Exelon and was a factor in the decision to vote negative. 2. Element 1: Please move the bullets under Attachment 1, Element 1 to Attachment 2, Element 2. Moving the bullets in the measures is consistent with CIP-004-5, R1.1. 3.Exelon supports the stand alone nature of the element 2 and 3 language. While the requirements in these elements are consistent with those in the corresponding requirements applicable to High and Medium impact BES Cyber Systems, it is

appropriate for those applicable to lows to be unique and appropriate to the risk presented by Low impact BES Cyber Systems. 4.Element 3: On electronic access controls, please offer more insight on “other electronic access controls that provide an equal or greater level of protection.” Exelon recognizes and appreciates that technology evolves and the requirement language should allow entities to use technology/methods that may prove useful in the future but not yet envisioned at the writing of the requirements. How does the drafting team envision that entities manage the comparison? 5.Element 4. Cyber Security Incident response: Please clarify the intent of “either by asset or group of assets…” Exelon pointed out in comments to the initial proposal that revision was needed to clarify that Cyber Security Incident response plans need not be site specific and that an enterprise-wide plan could fulfill the obligations for locations with low impact BES Cyber Systems. If this is the intent of the grouping language, Exelon supports the intent, but finds that the revision is not clear to that intent. If the intent is different, please explain and revise with clearer language. Consider the following revision: Cyber Security Incident response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s) covering either an individual asset or group of assets, which shall include: … Or just remove the comma after “plan(s)”. 6. Please justify the addition of 4.6 and 4.7 to the obligations of a Cyber Security Incident response plan. These elements were not required in the initial posting of the revisions and add an additional administrative burden to lows than was first proposed. Attachment 2 1.Exelon supports the use of Attachment 2 to provide added detail to the Measures. 2.See above for suggested move of Element 1 bullets from Attachment 1 to Attachment 2. 3.Element 1 – The wording can be clearer. Please consider the following revision (including the bullets from Attachment 1): “Element 1: An example of evidence for element 1 may include, but is not limited to documentation that cyber security practices have been reinforced once every 15 months through dated copies of the information used to emphasize security awareness via one or a combination of the following methods: Direct communications (for example, e-mails, memos, computer-based training); Indirect communications (for example, posters, intranet, or brochures); or Management support and reinforcement (for example, presentations or meetings).” Guidelines 1.Minor items: 1a - Page 33, Requirement R2 Attachment 1 – Physical Security, third paragraph, last sentence: Instead of “imply” consider require or obligate. 1b - Page 33, LEAP, third sentence, “LEAP” should be plural.
Yes
Yes
Exelon supports the proposed revisions to CIP-010-2. In our internal discussions, participants raised a couple questions. Exelon requests that the SDT consider incorporating responses to these questions either in a Q&A document or within the Guidelines. Below are the questions and draft responses from SDT outreach. Q and A Q1: Are contract obligations sufficient to fulfill the Element 2 requirements? A1: Yes, see Guidelines, in particular page 42: To facilitate these controls, Responsible Entities may choose to execute agreements with vendors and contractors to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department Of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. Elements

from the procurement language may unify vendor and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP Program elements may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the vendor's support. Entities should consider the elements of the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls. Q2: How often are entities required to scan Removable Media to fulfill element 3.2? A2: Frequency and timing of scanning was intentionally excluded from the requirement because there are multiple timing scenarios that can be incorporated into a plan to mitigate the risk of malicious code. The Removable Media must be scanned before it is connected to the BES Cyber Asset and that timing as dictated by the entity's plan should reduce the risk of malicious code mitigation.
Yes
Yes
Exelon supports the currently proposed Implementation Plan. We understand that others in the industry prefer to sync up the deadlines for the physical and electronic access control requirements. While Exelon would accept synced deadlines, it would do so only if the physical access controls deadline moved out to September 1, 2018 to match the electronic access controls deadline. Exelon prefers the staggered approach over moving the electronic access control deadline up to April 1, 2018. In addition, Exelon requests that the SDT consider incorporating responses to a question on the implementation plan either in a Q&A document or within the Guidelines. Below is a question and draft response from SDT outreach. Q and A Q1: Under the Cyber Security Incident response plan required to be in place by April 1, 2017, would a physical access incident be an incident if the physical access controls are not required until April 1, 2018? Likewise for electronic access controls not required until September 1, 2018? A1: The April 1, 2017 deadline requires that entities have a response plan in place. Since lows are not required to have ESPs or PSPs, the operative trigger is whether an event occurred that "Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System" (per the second bullet). As written in the implementation plan, between April 1, 2017 and the respective implementation deadlines for access controls, the entity would be required to demonstrate response to incidents that meet the second bullet; however, would not have to demonstrate the implementation of access controls that may have been related to the incident.
Yes
Exelon supports the Version X package of revisions and understands the need to have these revisions approved should they need to go forward independent of the revisions for Low Impact and Transient Devices. However, Exelon strongly supports the SDT's efforts to complete revisions in all four issues areas by the Feb 2015 filing deadline and hopes for a break in the revisions to the CIP standards. CIP resources are currently devoted to implementation of CIP Version 5. The task is daunting and resource intensive. Exelon looks forward to a stretch of time in which CIP work can focus on implementation without revisions

in development. In addition, timely resolution of the Order 791 CIP-003 directive is important to enable entities to avoid an iterative implementation of V5 and V6 for the Low Impact assets.
Yes
Concerns remain with the implications of the CIP-003 requirements on dispersed generation. Exelon supports the progress of the Order 791 revisions, but would like to see continued collaboration with the Project 2014-01 Applicability for Dispersed Generation Resources Standards to better balance the demonstration of compliance burden with the risk of dispersed generation facilities. Exelon thanks the SDT for their hard work in revising the CIP standards.

NYPA recommends that the language added to CIP-003-6, table R2 (Low Impact Assets) be moved to the specific tables in each of the Standards CIP-004-6 through CIP-011-2 where applicable. The inclusion of these control requirements for Low Impact Assets, as an Attachment to CIP-003-6, results in Standards language inconsistencies that creates confusion and is likely to cause additional compliance risks to entities having multiple impact levels. The following are some specific examples: A. The Low Cyber System requirements continue to be inconsistent with High / Medium requirements in other standards. These current inconsistencies have been attributed to deficiencies in the Quality Assurance process used prior to the release of this new draft, however, this only validates concerns that there will 'always' be inconsistencies of this type when the controls are split between the Standards as was done in this case. B. The shifting of the Low impact requirements to CIP-003-6, R2, breaks one of the prime objectives defined when CIP version 5 was being developed that each of the Standards (except CIP-002) be able to stand on its own. At entities with Low and either Medium or High Cyber Systems, it would be necessary that CIP-003 always be referenced when any of the requirements in CIP-004-6 through CIP-011-2 are being designed and implemented, since dependencies are always possible between Cyber Systems that are part of any impact category. This could also lead to the following: 1. If a BES asset contains Low and Medium or High Cyber Systems, it would be possible to violate multiple requirements in multiple Standards. This would be clearly be possible for some of the requirements in CIP-004, CIP-006 and CIP-008 (or any Standard with a facility impact), since having some 'Low's along with any other impact level Cyber Assets would apply to all Cyber Assets in that facility. 2. This further complicates the new policy and procedure structures that an entity needs to meet CIP version 5 compliance. The NIST-like structure outlined in CIP-003, R1, is likely the most common direction that most entities will choose to 'clearly' meet CIP Version compliance. Having the 'Low' impact Cyber Systems hanging 'out on a limb' in a CIP-003 Attachment will reduce the clarity of addressing the required controls for those assets in a 'mixed'-impact environment. The end of result of having Low Impact Asset controls contained only in CIP-003

is that going forward, as the CIP requirements are changed, the likelihood of creating additional inconsistencies is high. For example, if a slight change is made to a requirement in CIP-007-6, which somehow affects the set of Low Cyber Systems, then having to make a similar change to CIP-003-6, R2, in accounting for that change, may result in the change being missed and/or becoming inconsistent. These new set of CIP standards are already very complex, and any added confusion caused by this structural problem will result in difficult (and costly) compliance implementations. This will likely negate the goals of improving overall reliability.

No
Oncor supports EEI comments. Please reference EEI comments for suggested revisions. Additional comments below: CIP-010-2 R4 Attachment 1: Oncor utilizes embedded device platforms, such as Substation relays and RTUs, which are not as vulnerable to malicious code/Malware as computer systems. It is Oncor's interpretation that Substation embedded device platforms are afforded security features provided by nature of embedded controls. However, these embedded devices do not have access control or logging capabilities, therefore incapable to log users and/or generate logs. Therefore, it is not technically feasible to demonstrate that a specific Transient Device, such as a laptop, is connecting or was connected to such embedded device platform. CIP-010-2 R4 Attachment 1 Element 1.2.2: The Guidelines and Technical Basis page 44 Element 1.2.2 states: To meet this requirement part, the entity is to document the following: 1.2.2 Locations where the Transient Cyber Assets may be used. This can be done by listing a specific location or a group of locations. As previously mentioned, it is not technically feasible to authorize locations for Transient Devices, such as laptops, to access substation cyber assets. There are controls in place to restrict access such

as perimeter fence with locked gates, locked control house doors, and unique passwords to the assets. Oncor is seeking clarity on the following: Does the section on page 43 “Per Cyber Asset Capability” exclude the aforementioned Medium Impact BES Cyber Assets without ERC substation assets based on capabilities? Recommendation: Rewrite the Requirement, Attachment(s) and/or Guideline and Technical Basis to clarify and articulate that embedded device platforms, such as substation relays and RTUs, which are not vulnerable and incapable of control accessing or logging, are excluded from CIP-010-2. Alternatively, Limit applicability to Medium Impact BES Cyber Assets with ERC, or vulnerable to malicious code.

Duke Energy suggest the following revision to Low Impact BES Cyber System Electronic Access Point: “Low Impact BES Cyber System Electronic Access Point (LEAP): A Cyber Asset interface that permits Low Impact External Routable Connectivity. The Cyber Asset may reside at a location external to the asset or assets containing low impact BES Cyber Systems. The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System except when the LEAP is on the same Cyber Asset as an Electronic Access Control or Monitoring System.” We believe the use of the word “allows” is too broad whereas the word “permits” better reflects the SDT’s intent. The addition of “except when the LEAP is on the same Cyber Asset as an Electronic Access Control or Monitoring System” is needed for those instances when a LEAP is on the same Cyber Asset as an Electronic Access Control or Monitoring System.
No
Duke Energy suggests adding a time requirement in Attachment 2, section 1 similar to the one found in Attachment 1 section 1. As currently written, there does not appear to be a time requirement for the frequency with which an entity should review Transient Cyber Assets owned or managed by Vendors or Contractors. Is an entity required to review the items listed in section 2.1 every time a vendor logs on/ patches into the Cyber Asset?

Yes
We ask the SDT to provide an example of a device the is not capable of transmitting executable code. We are unclear as to an example of a Transient Cyber Asset that is not capable of transmitting executable code.
No
Duke Energy suggests revising the Compliance Date for CIP-003-6, Attachment 1, element 2 to coincide with the Compliance Date of CIP-003-6, Attachment 1, element 3. As currently written, it appears that the elements are circular in nature. Essentially, an entity would need to be compliant with element 3 before becoming compliant with element 2 and could be physically protecting a device that does not exist.
Yes
No

Pamela Hunter
No
Southern appreciates the substantial revisions to the requirements language in CIP-003 and Attachment 1 and offers several items for SDT consideration below. The new structure and overall content are a great improvement. The negative vote on CIP-003 is only to address these couple of issues but overall the newly drafted standard reflects the appropriate level of detail for requirements applicable to Low Impacts assets. Comment 1: CIP-003-6 – Attachment 1: CIP-003-6 Requirement R1, Part 1.2, Subpart 1.2.2 “Physical security controls” is inconsistent with Attachment 1, which uses “Physical access controls.” Recommendation: Change Attachment 1, Element 2 to “Physical security controls” to be consistent with the language of the standard. Please edit all other references (e.g., CIP-003-6 Attachment 2, Guidelines and Technical Basis, RSAWs) to CIP-003-6 R1 for consistency. Comment 2: CIP-003-6 Requirement R2 ends with “include the elements in Attachment 1”, although the first sentence in Element 1 says “include each of the elements provided below” the actual “elements” are not labelled “elements” as in Attachment 2, which references the elements in Attachment 1. Recommendation: Add “Element” before each numbered bullet in Attachment 1, using the same format as Attachment 2 uses. This would also be helpful for Attachment 1 in CIP-010-2. Comment 3: The “(LERC)” and “(LEAP)” acronyms are missing in Element 2, 3, and 3.1, which makes it harder to identify the use defined phrases in these elements. Recommendation: Add the “(LERC)” and “(LEAP)” to elements 2, 3, and 3.1 to make it easier to identify the acronym. Comment 4: CIP-003-6 Attachment 1, Element 4.7 assumes the response plan will need updates, which may not always be the case. Recommendation: Add “,

if needed," after "180 calendar days." Comment 5: CIP-003-6 Attachment 2 and Guidelines and Technical Basis for element 2: Attachment 2 (examples of evidence) for element 2 provides card key and special locks as examples of access controls; however, the Guidelines and Technical Basis for element 2 states "entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control." These inconsistencies make the language of the standard in Attachment 1 vague and unclear. Recommendation: Include "perimeter controls" under element 2, Attachment 2 in the example: "(e.g., card key, special locks, perimeter controls). Comment 6: CIP-003-6 Guidelines and Technical Basis for Requirement R2 Attachment 1 and the LERC definition – Electronic Access Controls: The following scenario is unclear: {Low impact BES Cyber System (e.g., control system) ---- |1| ---- Cyber Asset (e.g., data historian) ---- |2|} ---- Location X Where: {} represents the asset/site boundary, |1| represents a firewall or electronic access point (in this case firewall 1), and ---- represents a bi-directional routable communication Based on the language of the definition and CIP-003-6 it is unclear whether there is a LERC and LEAP in this scenario and if there is LERC, which firewall is the LEAP. The Guidelines and Technical Basis for CIP-003-6 say "the electronic access controls should address the risk of using the asset's LERC to gain access to the low impact BES Cyber Systems." However, this scenario would require an adversary to gain access to not one but two access points, the firewalls on either side of the Cyber Asset (firewall 2 and then firewall 1) to get access to the low impact BES Cyber System. Whereas, the examples provided all show one access point, the LEAP, which requires controls. Recommendation: Add this scenario to the CIP-003-6 Guidelines and Technical Basis, clarify that there is a LERC and allow the Responsible Entity to have the flexibility choose the LEAP, either firewall 1 or firewall 2. Comment 7: The Guidance on LEAP has the phrase "However the LERC between assets "behind" the LEAP and another asset containing a low impact BES Cyber System must also pass through the single LEAP". LERC between assets behind the LEAP" could imply connectivity between them is allowed without passing through the LEAP first – regardless of their communications with another asset containing a low impact BES Cyber System (which by definition would have to be behind a LEAP as well, but maybe not the same one). Southern Recommendation: Consider rephrasing to: However the LERC between assets "behind" the LEAP must pass through the single LEAP. Comment 8: The Guidance for LEAP does not clearly explain that the Network Interface Card (NIC) (a port) is the Low Impact BES Cyber System Electronic Access Point (LEAP) rather than the device containing the NIC. Therefore it is possible to have a NIC port inside a High or Medium Impact BES Cyber System Electronic Access Perimeter (ESP) in an Electronic Access Control or Monitoring System (EACMS). The LEAP does not need to be in an EACMS, but it can be. Recommendation: In the Guidelines and Technical Basis for CIP-003-6, where LEAP is described, move the sentence "LEAP are not to be considered EACMS…" to create a second paragraph and add "However a LEAP can be implemented within the same cyber asset that is serving the function of EACMS or EAP for a Medium or High BES Cyber System. This is possible because a LEAP is the interface on the controlling cyber asset (e.g., a firewall or router) and not the cyber asset itself."

No

Southern appreciates the new terms to help clarify the requirements language in CIP-003. The negative vote on CIP-003 is only to address these couple of issues. Comment 1: Use of “allows” in the LEAP definition does not allow for the use of an unmanaged hub. An unmanaged hub, which does not support access controls and may be acting as a central connecting point, could be considered an interface that “allows” Low Impact External Routable Connectivity and therefore would be improperly characterized as a LEAP. Element 3.1 of Attachment 1 CIP-003-6 requires inbound and outbound access control for LEAPs, which are not supported by unmanaged hubs. Recommendation: Change “allows” to “controls” to allow for the use of unmanaged hubs as appropriate. Please also make sure this is changed in the Guidelines and Technical Basis and anywhere else the LEAP definition is provided. Comment 2: In the LERC definition, example exclusions are listed. The need for the exclusions provided in the examples is unclear. Recommendation: Change the exclusion sentence to: “Point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions are excluded (example protocols include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).” Alternatively, clarify in the Guidelines and Technical Basis for CIP-003-6 that the exclusion is intended to include point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions.
No
Southern appreciates the revisions and overall direction that SDT made to the structure of CIP-010-2, R4 but offers the comments for consideration below to help with clarity. Comment 1: CIP-010-2 Attachment 1: The use of “Authorized” in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is redundant and unnecessary because (1) it already appears in the underscored text for 1.2 and 3.1, and 2) it is implied by the language of 1.2 and 1.3. The language of 1.2 and 1.3 requires a Responsible Entity to specify a user, location, and use for each Transient Cyber Asset (or group of) and specify a user and location for each Removable Media, which means an authorization. The redundancy creates uncertainty in the interpretation of the standard. It could be interpreted to imply a second step in addition to the R4 plan. In other words, in addition to the R4 plan for Transient Cyber Assets and Removable Media, which includes the 1.2 and 3.1 authorization elements, the Responsible Entity must also have a separate, formal approval process to identify authorized users, authorized locations, and authorized uses for Transient Cyber Assets and a separate formal approval process to identify who is authorized to use and where they are authorized to use Removable Media. We believe the intent of the Standards Drafting Team is that the plan should include authorization, which identifies the users, locations, and uses for each Transient Cyber Asset (or group of) and users and locations for each Removable Media, giving the Responsible Entity flexibility on how they write the plan to address these authorization elements. This flexibility will allow the Responsible Entity to either write a plan that specifically defines who is authorized to use the Transient Cyber Asset(s) for which uses and locations or include a separate authorization process, which may include a formal approval process, in the plan that identifies the users, locations, and uses authorized for the Transient Cyber Asset(s). It will also give the Responsible Entity the same flexibility for Removable Media authorizations. This flexibility is particularly needed for

Responsible Entities that rely on contractor use of Responsible Entity managed Transient Cyber Assets and Removable Media who have less control over the contractor, i.e., the control is defined by a service agreement or contract. Giving the Responsible Entity flexibility on how to define the authorization process will allow them to align these requirements with their vendor contracts. Recommendation: Remove “Authorized” from 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2. Alternatively, clarify in the Guidelines and Technical Basis under Element 1.2 and 3.1 that the use of “Authorized” in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 does not require a formal approval process for each user, location, and use of the Transient Cyber Asset (or Removable Media), but gives the Responsible Entity the flexibility to develop an authorization plan that either directly defines authorization or requires a specific authorization process. This allows Responsible Entities to align their Transient Cyber Asset and Removable Media authorizations with their vendor contracts for use of Responsible Entity managed Transient Cyber Assets. Comment 2: CIP-010-2- Attachment 1 Elements 1 and 2 are grouped by whether a Transient Cyber Asset is owned or managed by the Responsible Entity or by a vendor or contractor. The intent of this grouping is good because it considers the level of control by the Responsible Entity. However, the actual groupings could result in a Transient Cyber Asset that falls under both element 1 and 2. For example, if a Responsible Entity owns the Transient Cyber Asset, but a contractor manages its use under a service management contract. Another scenario is that the vendor owns the Transient Cyber Asset, but the Responsible Entity manages it. For these scenarios, it is unclear whether the Responsible Entity should include element 1 or 2 or both elements in their R4 plan(s). Recommendation: Remove “Owned or” from elements 1 and 2. Comment 3: CIP-010-2 Attachment 1, section 1.5: Currently drafted as: Transient Cyber Asset resides within a location with restricted physical access; Recommendation: Consider rephrasing to say: The Transient Cyber Asset must reside within a location with restricted physical access; Comment 4: CIP-010-2 - Attachment 1, Element 2.3: “Responsible Entities shall determine whether additional mitigation actions are necessary…” requires a statement that says no additional mitigation measures were identified as necessary, which creates an unnecessary administrative burden. Also, Element 2.3 is an element that should be addressed by the R4 plan for Transient Cyber Assets and Removable Media, the way Element 2.3 is written makes it look like a requirement rather than a plan element, which also causes confusion as to the frequency of review for elements 2.1 and 2.2. Element 2.3 as written suggests that a Responsible Entity must use the 2.3 and 2.4 mitigation methods prior to each connection of a vendor-owned Transient Cyber Asset in order to determine whether additional mitigation measures will be needed. This can be overly burdensome and unnecessary when a vendor is moving from system to system in a single day. Also, a Transient Cyber Asset may be owned by the Responsible Entity and managed by a vendor or owned by the vendor/contractor and managed by the Responsible Entity. The use of “vendor- or contractor-owned” in 2.3 is not consistent with these scenarios (see comment 3.3 above). Recommendation: Add “necessary” before “such actions.” Also, clarify in the Guidelines and Technical Basis that the Responsible Entity has flexibility in determining how to manage vulnerability and malicious code reviews of their vendors or contractors and require additional mitigation actions. For example, one entity may require a vendor to plug a Transient Cyber Asset into a kiosk to scan for vulnerabilities and malicious code before each

connection. However, this approach may not be feasible for all entities, so defining a process to initially and periodically check and audit vendor/contractor processes for vulnerability and malicious code mitigation. Specifically, “prior to connecting the vendor- or contactor-owned Transient Cyber Asset” does not require that 2.1, 2.2, and 2.3 before each connection, but that the Responsible Entity should define a process to manage the use of vendor- or contractor- managed Transient Cyber Assets to mitigate vulnerabilities and malicious code. Also, change “owned” in 2.3 to “managed.” Comment 5: CIP-010-2 – Attachment 2, elements 1.3, 1.4, 1.5, 2.1, 2.2, 2.3, and 3.2: The use of “mitigate” and “mitigation” should be explained to make it clear to auditors that mitigate/mitigation means to reduce risk and does not mean that every vulnerability must be addressed and every piece of malicious code detected and stopped. Recommendation: Make it clear in the Guidelines and Technical Basis that “mitigate” and “mitigation” does not require that every vulnerability is addressed, as many may be unknown or not have an impact on the system that the Transient Cyber Asset or Removable Media is used on. Also, it may be impossible to detect every piece of malicious code. Mitigation is meant to reduce security risks, but elimination of all risk is impossible. Comment 6: CIP-010-2 – Attachment 2, Element 3.2: This requirement is too restrictive and does not mitigate risks. Capabilities exist for embedded, real-time virus scanning and encryption on USB drives, but Element 3.2 prevents their use. Also, 3.2 does not require the Responsible Entity to take any action other than scanning Removable Media at some point in time. Recommendation: Change “scan Removable Media outside of the BES Cyber System” to “use a method to scan Removable Media for malicious code and a procedure to respond to detected malicious code.” Comment7: Guidelines and Technical Basis for R4, Attachment 1, Element 1.1: inventories of Transient Cyber Assets is allowed by individual or group – individually or by asset type, therefore language under Element 1.1 should be consistent, allowing inventory of devices or device type. Recommendation: Add “or device types” to the second sentence: “pre-authorize and inventory of devices or device types or authorize devices or device types at the time of connection or use a combination of these methods.”

No

Comment 1: Transient Cyber Asset Definition: The “and” in the parenthesis after “A Cyber Asset,” is confusing and appears to be misplaced. It could be interpreted as meaning a Cyber Asset must use all of these types of communication connections. It refers to examples of communication types not Cyber Assets. Also, the definition makes it unclear whether a Transient Cyber Asset could also be a BES Cyber Asset or a Protected Cyber Asset and therefore which requirements apply. For example, if a Responsible Entity defines a BES Cyber System to include a device, which could also be considered a Transient Cyber Asset, does the BES Cyber System requirements apply, the Transient Cyber Asset requirements, or both? Finally, “directly connected” may be interpreted as meaning only non-routable communications; however, we believe the intent is to include both routable and non-routable communications. Recommendation: Change the definition for Transient Cyber Asset to: “A Cyber Asset that is not included in a BES Cyber System and is not a Protected Cyber Asset (PCA) and is capable of transmitting executable code that is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth) for 30 consecutive calendar days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3)

a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.” Also, if the intent is for the Transient Cyber Asset definition to apply to both routable and non-routable communications, clarify this in the Guidelines and Technical Basis for CIP-010-2.
No
Southern appreciates the revised schedule and supports the increased timeframe for implementation. The only reason for the negative vote is the disconnect between the dates as noted below. Comment 1: CIP-003-6, Attachment 1, Element 2 compliance date of April 1, 2018: According to the Implementation Plan, the Element 2 physical access controls must be applied to LEAPs by April 1, 2018; however, the LEAPs are identified under Element 3, which must be applied by September 1, 2018. Recommendation: The compliance date for LEAPs is after the compliance date for physical, but the two are tied together since LEAPs have to be physically secured. These two dates should be the same or please add clarity on how best to implement the requirements based on disconnect between the two timeframes.
Yes
Southern supports the Version X package of revisions.
Yes
Southern would like to commend the SDT for all the hard work and effort that has gone into revising the CIP Standards.

Incoherence with CIP-002-5 are observed. Elements of CIP003-6 R2 are base on new definitions that applies to elements explicitely excluded from CIP-002-5. CIP-005 need to be ajusted to reflect the real intentions of the SDT. Incoherence are observed for the implementation dates: CIP-003-6, Attachement 1,element 1 until the later of April 1, 2017 CIP-003-6, Attachment 1, element 2 until the later of April 1, 2018 CIP-003-6, Attachment 1, element 3 until the later of September 1, 2018 CIP-003-6, Attachment 1, element 4 until the later of April 1, 2017 Physical requirement (element 2) goes in effect before the electronic ones (element 3). Requirement 2 demands to restric acces point of low BCS while low BCS a covered 5 months later.

No
No, we do not agree. The protections suggested for low impact assets still represent too large a pool of assets that do not have a substantive impact to the BES, the reference to electronic and physical controls language required for low impact assets is vague and open to much interpretation, and the requirement for issues to be reported to the ES-ISAC does not support measured improvement for reliability and security of the BES.
No
The new definitions do not add clarity, but rather confusion and complexity. Entities will be better served by describing the connectivity to their assets and how the entity manages security and reliability of those assets. Entities should explain how they mitigate risk and manage assets in support of BES reliability.
No
KCP&L, in agreement with SPP, offers the following comments. Item 1.2 in Attachment 1 contains requirements already covered in other standards. An authorized user will be on the entity's list required by CIP-004-6 Requirement 4. Thus, Item 1.2 is not needed. Also, this standard does not define when actions should take place. Clarification is needed and should be placed for industry vote on requirements addressing a Vendor's Transient Cyber Assets.
Yes
No
KCP&L, in agreement with SPP comments, offers the following comments. While additional time to complete tasks resulting from changes in the standard is welcome, the number of dates to manage is not. There should be one date for High and Medium Impact BES Cyber Assets and their accompanying devices and one for Low Impact BES Cyber Assets and associated devices. We would recommend that the latest date for each grouping be chosen as a new effective date for all requirements.

SMUD does suggest an important edit to Attachment 1, Element 1 to clarify the obligation. The posted language requires “Each Responsible Entity shall reinforce, once every 15 calendar months, its cyber security practices, using one or a combination of the following methods:…” Literal reading of this obligation means that entities are required to perform security awareness on a specific 15 month cycle. To align this obligation with that of CIP-004-5, R1, Part 1.1, SMUD requests the following edit: “Each Responsible Entity shall reinforce, AT LEAST ONCE every 15 calendar months, its cyber security practices, using one or a combination of the following methods.” This establishes that the obligation of security awareness just needs to occur at least once over a 15 calendar month cycle.
Yes
FMPA supports EEI’s comment regarding the definition of a LEAP: The definition and guidance for LEAP does not clearly explain that the Network Interface Card (NIC) (a port) is the Low Impact BES Cyber System Electronic Access Point (LEAP) rather than the device containing the NIC. Therefore it is possible to have a NIC port inside a High or Medium Impact BES Cyber System Electronic Access Perimeter (ESP) in an Electronic Access Control or Monitoring System (EACMS). The LEAP does not need to be in an EACMS, but it can be. Recommendation: In the Guidelines and Technical Basis for CIP-003-6, on page 42 of 49 where LEAP is described, move the sentence “LEAP are not to be considered EACMS…” to create a second paragraph and add “However a LEAP can be implemented within the same cyber asset that is serving the function of EACMS or EAP for a Medium or High BES Cyber System. This is possible because a LEAP is the interface on the controlling cyber asset (e.g., a firewall or router) and not the cyber asset itself.”
No
FMPA supports EEI’s comment regarding Attachment 2 of CIP-010-2: CIP-010-2 – Attachment 2, elements 1.3, 1.4, 1.5, 2.1, 2.2, 2.3, and 3.2: The use of “mitigate” and “mitigation” should be explained to make it clear to auditors that mitigate/mitigation means to reduce risk and does not mean that every vulnerability must be addressed and every piece of malicious code detected and stopped.
Yes
FMPA supports SMUDs comments regarding Transient Cyber Assets and Removable Media: SMUD agree with the changes that were made by the SDT to both Transient Cyber Assets and Removable Media definitions. However, SMUD is concerned with starting the definition of Removable Media with the capitalized “Media” considering that “Media” is itself not a defined term. SMUD recommends an edit to resolve this concern: Removable Media: One or more media directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, or access data. Removable

Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.
Yes
FMPA supports SMUDs comments for CIP-006-6: SMUD agrees and supports the proposed implementation plan deadlines for CIP-003-6, R2. SMUD appreciates that the SDT has provided a tiered approach to the implementation of physical security and electronic access controls. SMUD believes that even with the tiered approach to the implementation plan, entities are not restricted from implementing both controls in parallel. Considering the diverse nature of the facilities and systems, SMUD believes the additional compliance time as well as the tiered approach provides entities the needed flexibility to evaluate their physical security and system capabilities to effectively apply the new requirements. There are possibilities that physical modifications will need to be made to facilities to deploy the necessary controls to restrict physical access. Additionally, to deploy a Low Impact Electronic Access Point, it is possible that certain systems or computer network architectures may need to be modified to accommodate the additional of an access point.
No
The SDT has done an excellent job of addressing the IAC language along with their outreach and addressing stakeholder comments. FMPA can agree with the removal of the IAC language, but unfortunately, the current RSAWs do not provide enough clarity and guidance on compliance expectations to understand if “zero tolerance” concerns have been addressed. There is substantive work that needs to be done on the RSAWs, especially in light of the removal of the IAC language and the fact that RAI program documents have just been recently released and RAI is in early implementation stages. It’s not clear that RAI will address the “zero tolerance” concerns since there is processing and reporting required for 100% of non-compliance. More clarity around the RAI program may address this but it’s not clear at this point. The RSAWs are also a tool to address this matter.
Yes
FMPA’s negative votes are due to the current condition of the RSAWs and the status of RAI implementation. We expect that affirmative votes can be cast if : a. Compliance staff collaborates with the SDT on the RSAW revisions for the next posting that will significantly improve the RSAWs and b. if more clarity is communicated around how RAI addresses “zero tolerance”. FMPA also supports EEI’s comments regarding CIP-007-5: CIP-007-6 R2: Can you violate 2.3 while you meet 2.4? If you identify a patch within 35 days of evaluation and create a dated mitigation plan that says 8 months, but then 2 months later, the implementation of the patch is delayed a month because you can’t take the system down, the plan under 2.3 is no longer valid and you cannot revise it under 2.3 since 35 days have passed; however, under 2.4 you can revise the plan so 2.4 is not violated. Is 2.3 violated in this case?

No
We agree with all except the two items below: Not as written specific to CIP-003-6 Attachment 1 numbers 3 and 4.7. Number 3 has the potential to create significant undue burden on entities. This language begins to treat Low Impact assets as if they could have some sort of significant impact on the BES and begins to approach the compliance activities that are applicable to more significant Medium and High Impact assets. Many entities own a significant number of geographically dispersed Low Impact assets with a multitude of cyber asset types making compliance with this language very time and resource intensive. If this level of compliance activities is mandated, the associated implementation deadline would need to be significantly delayed. This also increases the risk of losing focus on the Medium and High Impact assets. Number 4.7 requires updating the plan within 180 days after a test or actual incident without mention of a need for a change being identified that would drive the update. What update is an entity expected to make if the plan is well designed and the test or response to an actual incident was completely successful? We suggest modifying 4.7 to require the update of the plan when corrections or improvements are identified during a test or response to an actual incident.
Yes

No
The SDT made significant improvements to the language and the structure of these Requirements. There remain a few inconsistencies and clarification items that are potential trouble spots which necessitate a negative ballot. These are listed below: Attachment 1: The language in Element 1 “using one or a combination of the following” is inconsistent with the Element 2 language “through one or more of the following.” We recommend the SDT change the language in Element 1 to “through one or more of the following.” CIP-003-6 Requirement

R1, Part 1.2, Subpart 1.2.2 “Physical security controls” is inconsistent with Attachment 1, which uses “Physical access controls.” We recommend the SDT change Attachment 1, Element 2 to “Physical security controls” to be consistent with the language of the standard. This would extend to all other references (e.g., CIP-003-6 Attachment 2, Guidelines and Technical Basis, RSAWs). Attachment 1, Element 4.7 assumes the response plan will always need updates, which may not be the case. We recommend to add the important clarifier “if needed,” after the words “180 calendar days.” Beyond the changes outlined above, we note that the nature of the changes for CIP-003-6 to accommodate the Commission’s directive on Low Impact cyber assets hinge on the new terms introduced in this posting (LERC and LEAP). As noted in the following question response, we are advising several important changes to these terms. Without some assurance that these changes will be adopted, we cannot determine the suitability of CIP-003-6 and therefore cannot cast an affirmative ballot amid the uncertainty of the resolution on these definitions.
No
LEAP: The use of the word “allows” in the LEAP definition is not compatible with the use of an unmanaged hub. Such an unmanaged hub, which does not support any access controls and may be merely acting as a central connecting point, would be considered an interface that “allows” Low Impact External Routable Connectivity and therefore would be improperly characterized as a LEAP. Element 3.1 of Attachment 1 CIP-003-6 requires inbound and outbound access control for LEAPs, which are not supported by unmanaged hubs and would therefore be problematic for compliance with this requirement. We recommend the SDT change the word “allows” to “controls”, which will therefore exclude unmanaged hubs from any requirements involving LEAPs. LERC: In the LERC definition, example exclusions are listed. The need for the exclusions provided in the examples is unclear. We recommend to change the exclusion sentence to: “Point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions are excluded (example protocols include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).”
No
In Attachment 1, the use of “Authorized” in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is redundant and unnecessary because (1) it already appears in the underscored text for 1.2 and 3.1, and (2) it is already implied by the language of 1.2 and 1.3. The language of 1.2 and 1.3 requires a Responsible Entity to specify a user, location, and use for each Transient Cyber Asset (or group of) and specify a user and location for each Removable Media, which amounts to an “authorization.” The redundancy creates uncertainty in the interpretation of the standard, and could call into question whether a second step of authorization is prescribed. We recommend the removal of the word “Authorized” from 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 as well as appropriate clarification in the Guidelines and Technical Basis. In Attachment 2, Element 3.2 is too restrictive and does not serve to mitigate risks. Capabilities exist for embedded, real-time virus scanning and encryption on USB drives, but Element 3.2 prevents their use. Also, 3.2 does not require the Responsible Entity to take any action other than scanning Removable Media at some point in time. We recommend that the SDT change “scan

Removable Media outside of the BES Cyber System" to "use a method to scan Removable Media for malicious code and a procedure to respond to detected malicious code."
Yes
Yes
We generally support the implementation plan as a whole; however, there appears to be a conflict between the date for which LEAPs are to be identified under Element 3 and the date that physical access controls are to be applied to these LEAPs (Sept 1, 2018 for the former; April 1, 2018 for the latter).

SPP and specific Members
Lesley Bingham
Yes

No
The new definitions do not add clarity, but rather confusion and complexity. There is audit risk for an entity if their interpretation of these terms differs from that of their Compliance Enforcement Authority. Most entities will be better served by describing the connectivity to their assets through a policy statement which can be crafted to address a specific location.
No
Item 1.2 in Attachment 1 contains requirements already covered in other standards. An authorized user will be on the entity's list required by CIP-004-6 Requirement 4. Thus, Item 1.2 is not needed. Also, this standard does not define when actions should take place. Should a Vendor's Transient Cyber Asset and processes be reviewed every time the Vendor touches and entity's systems? Annually? Once and then not again? Clarification is needed on this point.
Yes
No
While additional time to complete tasks resulting from changes in the standard is welcome, the number of dates to manage is not. There should be one date for High and Medium Impact BES Cyber Assets and their accompanying devices and one for Low Impact BES Cyber Assets and theirs. We would recommend that the latest date for each grouping be chosen as a new effective date for all requirements.
No
The removal of the IAC language has been closely tied to the proposed Reliability Assurance Initiative (RAI). While that program can, ideally, allow for auditors to review an entity's controls which will identify, assess, and correct issues, the RAI program is not complete and has not been used in the audit and enforcement process. Simply put, this requires a significant amount of trust. The IAC language provides a more clear path and boundaries for auditors.

MMWEC respectfully submits the following suggestions for clarifying and improving the CIP-003-6 Attachments 1 and 2. Attachment 1, Element 1: change "once every 15 calendar months" to "at least once every 15 calendar months." In Attachment 2, Element 1 - change "once every 15 calendar months" to "at least once every 15 calendar months" or delete "once every 15 months. Attachment 1, Element 2: It is not clear whether the phrase "based on need" refers to the need to restrict physical access or the need to allow certain physical access. Does it mean that entities are required to restrict access by default and justify any allowed access? The Attachment 2 example for Element 2 indicates that an entity must describe the operational need for physical access, but also contains the confusing phrase "restrictions cited above are based on need" implying that it is the "restriction" that must be justified and documented. Please clarify. Attachment 1, Element 4.1: Change "Identification, classification, and response to Cyber Security Incidents" to "Identification and classification of Cyber Security Incidents." Delete “response” because "response" is a sub-set of "incident handling" which is required by Element 4.4. Attachment 1, Element 4.3: Since testing of the Cyber Security Incident Response Plan is required only every 36 months, entities should be required to ensure that individuals are aware of their response roles through more frequent training or review of their responsibilities. Consider modifying Element 4.3 to require those groups and individuals to review their roles and responsibilities for Cyber Security Incident response at least once every 15 months. Attachment 2, Element 3: Change "(e.g. IP addresses, ports, services)" to "(e.g., by restricting IP addresses, ports and/or services)" and move this phrase to follow "deems necessary" later in the same sentence. It is not clear from the current wording whether an entity must restrict using all of the example attributes.

No

MMWEC is concerned with the use of the phrase “low impact BES Cyber System.” Shouldn’t this be “BES Cyber Systems associated with Low Impact assets?” For the definition of LERC, consider changing “Communication protocols created…” to “Communication using protocols created…”

No

MMWEC respectfully submits the following suggestions for improving the CIP-010-2 Attachment 1. CIP-010-2, Attachment 1 should be limited to requiring control objectives not specific controls. Bullets are example controls and should not be include in Attachment 1 requirements. These examples should be moved to Attachment 2 or to guidance. CIP-010, Attachment 1, Element 1.1 is a method of compliance rather than a control objective. It is unnecessary and should be deleted from Attachment 1 and moved to guidance. The following is recommended wording for control objectives for Attachment 1 Elements 1.3, 1.4, 1.5, 2.1 and 2.2: "1.3 - Each Responsible Entity shall mitigate security vulnerabilities on Transient Cyber Assets." “1.4 Each Responsible Entity shall mitigate the risk of introduction of malicious code (per Transient Cyber Asset capability.)” “1.5 Each Responsible Entity shall mitigate the risk of unauthorized use of Transient Cyber Assets.” “2.1 Each Responsible Entity shall mitigate the risk of security vulnerabilities (per Transient Cyber Asset capability.)” “2.2 Each Responsible Entity shall mitigate the risk of introduction of malicious code (per Transient Cyber Asset capability.)” Using control objectives for elements 2.1 and 2.2, element 2.3 is redundant and should be deleted from Attachment 1. CIP-010, Attachment 1, Element 3.2 –

Change entire element to "Each Responsible Entity shall mitigate the risk of introduction of malicious code associated with the use of Removable Media." The examples of how to do this (i.e., scanning) could be included in Attachment 2 or guidance.
No
It not clear whether a Cyber Asset that meets the definition of BES Cyber Asset could be categorized as a Transient Cyber Asset (and require only the controls for Transient Cyber Assets) if it is connected for less than 30 days. To clarify that it cannot be classified as a Transient Cyber Asset, MMWEC recommends adding the following sentence to the end of the definition of Transient Cyber Asset,: "A Cyber Asset that meets the definition of BES Cyber Asset shall not be categorized as a Transient Cyber Asset." Another approach to this issue would be to restrict application of the Transient Cyber Asset category by changing the last sentence to “Transient Cyber Assets are limited to Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.”
Yes
Yes
No
Group
Edison Electric Institute (EEI)
Melanie Seader
No
EEI appreciates the efforts of the Standard Drafting Team (SDT) in revising CIP-003-6 to meet stakeholder concerns. We believe CIP-003-6 is close, but not yet ready for final ballot due to the following comments. We encourage the SDT to consider all of these comments carefully as our members have worked hard to explain their concerns in these comments as well as provide specific recommendations to help the SDT. Comment 1.1: CIP-003-6 Rationale for Requirement R2: “Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised.” Aggregating low impact BES Cyber Systems across multiple assets does not reflect a true risk-based assessment and therefore this sentence is not accurate. Recommendation 1.1: Delete this sentence. Comment 1.2: CIP-003-6 – Attachment 1: The language in Element 1 “using one or a combination of the following” is inconsistent with the Element 2 language “through one or more of the following.” Recommendation 1.2: Change the language in Element 1 to “through one or more of the following.” Comment 1.3: CIP-003-6 – Attachment 1: CIP-003-6 Requirement R1, Part 1.2, Subpart 1.2.2 “Physical security controls” is inconsistent with Attachment 1, which uses “Physical access controls.” Recommendation 1.3: Change Attachment 1, Element 2 to “Physical security controls” to be

consistent with the language of the standard. Please edit all other references (e.g., CIP-003-6 Attachment 2, Guidelines and Technical Basis, RSAWs) to make them consistent with the CIP-003-6 R1 language. Comment 1.4: CIP-003-6 Requirement R2 ends with "include the elements in Attachment 1," although the first sentence in Element 1 says "include each of the elements provided below" the actual "elements" are not labelled "elements" as in Attachment 2, which references the elements in Attachment 1. Recommendation 1.4: Add "Element" before each numbered bullet in Attachment 1, using the same format as Attachment 2 uses. This would also be helpful for Attachment 1 in CIP-010-2. Comment 1.5: The "(LERC)" and "(LEAP)" acronyms are missing in Element 2, 3, and 3.1, which makes it harder to identify the use of these defined terms in these elements. Recommendation 1.5: Add the "(LERC)" and "(LEAP)" to elements 2, 3, and 3.1 to make it easier to identify the terms. Comment 1.6: CIP-003-6 Attachment 1, Element 4.7 assumes the response plan will need updates, which may not always be the case. Recommendation 1.6: Add ", if needed," after "180 calendar days." Comment 1.7: CIP-003-6 Attachment 2 and Guidelines and Technical Basis for Element 2: Attachment 2 (examples of evidence) for Element 2 provides card key and special locks as examples of access controls; however, the Guidelines and Technical Basis for Element 2 states "entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control." These inconsistencies make the language of the standard in Attachment 1 vague and unclear. Recommendation 1.7: Include "perimeter controls" under Element 2, Attachment 2 in the example: "(e.g., card key, special locks, perimeter controls). Comment 1.8: CIP-003-6 Guidelines and Technical Basis, Requirement R2 Attachment 1 bold text subtitles on page 32: The subtitles are inconsistent with the element language in Attachment 1. Recommendation 1.8: Change the subtitle language to "Requirement R2 Attachment 1 – Cyber Security Awareness" and "Requirement R2 Attachment 1 – Physical Security Controls" (see Comment and Recommendation 1.3 above).

No

Comment 2.1: Use of "allows" in the LEAP definition does not allow for the use of an unmanaged hub. An unmanaged hub, which does not support access controls and may be merely acting as a central connecting point, could be considered an interface that "allows" Low Impact External Routable Connectivity and therefore would be improperly characterized as a LEAP. Element 3.1 of Attachment 1 CIP-003-6 requires inbound and outbound access control for LEAPs, which are not supported by unmanaged hubs. Recommendation 2.1: Change "allows" to "controls" to allow for the use of unmanaged hubs as appropriate. Please also make sure this is changed in the Guidelines and Technical Basis and anywhere else the LEAP definition is provided. Comment 2.2: Because the acronyms LEAP and LERC are used to help simplify the terms defined and used in the standard, it would help to include the acronyms each time the terms are spelled out in full in the definitions and in the standards and related guidance. Recommendation 2.2: Insert the acronyms "(LERC)" and "(LEAP)" as they are spelled out in the definitions. Comment 2.3: In the LERC definition, example exclusions are listed. The need for the exclusions provided in the examples is unclear. Recommendation 2.3: Change the exclusion sentence to: "Point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication

protocols for time sensitive protection and/or control functions are excluded (example protocols include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols)." Also, clarify in the Guidelines and Technical Basis for CIP-003-6 that the exclusion is intended to include point-to-point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time sensitive protection and/or control functions. Comment 2.4: The definition and guidance for LEAP does not clearly explain that the Network Interface Card (NIC) (a port) is the Low Impact BES Cyber System Electronic Access Point (LEAP) rather than the device containing the NIC. Therefore it is possible to have a NIC port inside a High or Medium Impact BES Cyber System Electronic Access Perimeter (ESP) in an Electronic Access Control or Monitoring System (EACMS). The LEAP does not need to be in an EACMS, but it can be. Recommendation 2.4: In the Guidelines and Technical Basis for CIP-003-6, where LEAP is described, move the sentence "LEAP are not to be considered EACMS…" to create a second paragraph and add "However a LEAP can be implemented within the same cyber asset that is serving the function of EACMS or EAP for a Medium or High BES Cyber System. This is possible because a LEAP is the interface on the controlling cyber asset (e.g., a firewall or router) and not the cyber asset itself." Comment 2.5: Based on the LERC definition and the CIP-003-6 Guidelines and Technical Basis for Requirement R2 Attachment 1 – Electronic Access Controls, the following scenario is unclear: {Low impact BES Cyber System (e.g., control system) ---- |1| ---- Cyber Asset (e.g., data historian) ---- |2|} ---- Location X Where: {} represents the asset/site boundary, |1| represents a firewall or electronic access point (in this case firewall 1), and ---- represents a bi-directional routable communication Based on the language of the definition and CIP-003-6 it is unclear whether there is a LERC and LEAP in this scenario and if there is LERC, which firewall is the LEAP. The Guidelines and Technical Basis for CIP-003-6 say "the electronic access controls should address the risk of using the asset's LERC to gain access to the low impact BES Cyber Systems." However, this scenario would require an adversary to gain access to not one but two access points, the firewalls on either side of the Cyber Asset (firewall 2 and then firewall 1) to get access to the low impact BES Cyber System. Whereas, the examples provided all show one access point, the LEAP, which requires controls. Recommendation 2.5: Add this scenario to the CIP-003-6 Guidelines and Technical Basis, clarify that there is a LERC and allow the Responsible Entity to have the flexibility choose the LEAP, either firewall 1 or firewall 2.

No

EEI appreciates the efforts of the Standard Drafting Team (SDT) in revising CIP-010-2 to meet stakeholder concerns. We believe CIP-010-2 is close, but not yet ready for final ballot due to the following comments. We encourage the SDT to consider all of these comments carefully as our members have worked hard to explain their concerns in these comments as well as provide specific recommendations to help the SDT. Comment 3.1: CIP-010-2 R4: The placement of "under CIP Exceptional Circumstances," is awkward. Recommendation 3.1: Move "under CIP Exceptional Circumstances" up in the sentence, such that it reads "…shall implement, except under CIP Exceptional Circumstances, one or more documented plan(s)…" Comment 3.2: CIP-010-2 Attachment 1: The use of "Authorized" in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is redundant and unnecessary because (1) it already appears in the underscored text for 1.2 and 3.1, and 2) it is implied by the language of 1.2 and 1.3. The language of 1.2

and 1.3 requires a Responsible Entity to specify a user, location, and use for each Transient Cyber Asset (or group of) and specify a user and location for each Removable Media, which means an authorization. The redundancy creates uncertainty in the interpretation of the standard. It could be interpreted to imply a second step in addition to the R4 plan. In other words, in addition to the R4 plan for Transient Cyber Assets and Removable Media, which includes the 1.2 and 3.1 authorization elements, the Responsible Entity must also have a separate, formal approval process to identify authorized users, authorized locations, and authorized uses for Transient Cyber Assets and a separate formal approval process to identify who is authorized to use and where they are authorized to use Removable Media. We believe the intent of the Standards Drafting Team is that the plan should include authorization, which identifies the users, locations, and uses for each Transient Cyber Asset (or group of) and users and locations for each Removable Media, giving the Responsible Entity flexibility on how they write the plan to address these authorization elements. This flexibility will allow the Responsible Entity to either write a plan that specifically defines who is authorized to use the Transient Cyber Asset(s) for which uses and locations or include a separate authorization process, which may include a formal approval process, in the plan that identifies the users, locations, and uses authorized for the Transient Cyber Asset(s). It will also give the Responsible Entity the same flexibility for Removable Media authorizations. This flexibility is particularly needed for Responsible Entities that rely on contractor use of Responsible Entity managed Transient Cyber Assets and Removable Media who have less control over the contractor, i.e., the control is defined by a service agreement or contract. Giving the Responsible Entity flexibility on how to define the authorization process will allow them to align these requirements with their vendor contracts. Recommendation 3.2: Remove “Authorized” from 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2. Also, clarify in the Guidelines and Technical Basis under Element 1.2 and 3.1 that the use of “Authorized” in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 does not require a formal approval process for each user, location, and use of the Transient Cyber Asset (or Removable Media), but gives the Responsible Entity the flexibility to develop an authorization plan that either directly defines authorization or requires a specific authorization process. This allows Responsible Entities to align their Transient Cyber Asset and Removable Media authorizations with their vendor contracts for use of Responsible Entity managed Transient Cyber Assets. Comment 3.3: CIP-010-2-Attachment 1 Elements 1 and 2 are grouped by whether a Transient Cyber Asset is owned or managed by the Responsible Entity or by a vendor or contractor. The intent of this grouping is good because it considers the level of control by the Responsible Entity. However, the actual groupings could result in a Transient Cyber Asset that falls under both element 1 and 2. For example, if a Responsible Entity owns the Transient Cyber Asset, but a contractor manages its use under a service management contract. Another scenario is that the vendor owns the Transient Cyber Asset, but the Responsible Entity manages it. For these scenarios, it is unclear whether the Responsible Entity should include element 1 or 2 or both elements in their R4 plan(s). Recommendation 3.3: Remove “Owned or” from elements 1 and 2. Comment 3.4: CIP-010-2 - Attachment 1, Element 2.3: “Responsible Entities shall determine whether additional mitigation actions are necessary…” requires a statement that says no additional mitigation measures were identified as necessary, which creates an unnecessary

administrative burden. Also, Element 2.3 is an element that should be addressed by the R4 plan for Transient Cyber Assets and Removable Media, the way Element 2.3 is written makes it look like a requirement rather than a plan element, which also causes confusion as to the frequency of review for elements 2.1 and 2.2. Element 2.3 as written suggests that a Responsible Entity must use the 2.1 and 2.2 mitigation methods prior to each connection of a vendor-owned Transient Cyber Asset in order to determine whether additional mitigation measures will be needed. This can be overly burdensome and unnecessary when a vendor is moving from system to system in a single day. Recommendation 3.4: Add "necessary" before "such actions." Also, clarify in the Guidelines and Technical Basis that the Responsible Entity has flexibility in determining how to manage vulnerability and malicious code reviews of their vendors or contractors and require additional mitigation actions. For example, one entity may require a vendor to plug a Transient Cyber Asset into a kiosk to scan for vulnerabilities and malicious code before each connection. However, this approach may not be feasible for all entities, so defining a process to initially and periodically check and audit vendor/contractor processes for vulnerability and malicious code mitigation. Specifically, "prior to connecting the vendor- or contactor-owned Transient Cyber Asset" does not require that 2.1, 2.2, and 2.3 before each connection, but that the Responsible Entity should define a process to manage the use of vendor- or contractor- managed Transient Cyber Assets to mitigate vulnerabilities and malicious code. Comment 3.5: CIP-010-2 – Attachment 1, Element 2.3 : A Transient Cyber Asset may be owned by the Responsible Entity and managed by a vendor or owned by the vendor/contractor and managed by the Responsible Entity. Therefore the use of "vendor- or contractor-owned" in 2.3 is not consistent with these scenarios (see Comment and Recommendation 3.3 above). Recommendation 3.5: Change "owned" in 2.3 to "managed." Comment 3.6: CIP-010-2 – Attachment 2, elements 1.3, 1.4, 1.5, 2.1, 2.2, 2.3, and 3.2: The use of "mitigate" and "mitigation" should be explained to make it clear to auditors that mitigate/mitigation means to reduce risk and does not mean that every vulnerability must be addressed and every piece of malicious code detected and stopped. Recommendation 3.6: Make it clear in the Guidelines and Technical Basis that "mitigate" and "mitigation" does not require that every vulnerability is addressed, as many may be unknown or not have an impact on the system that the Transient Cyber Asset or Removable Media is used on. Also, it may be impossible to detect every piece of malicious code. Mitigation is meant to reduce security risks, but elimination of all risk is impossible. Comment 3.7: CIP-010-2 – Attachment 2, Element 3.2: This requirement is too restrictive and does not mitigate risks. Capabilities exist for embedded, real-time virus scanning and encryption on USB drives, but Element 3.2 prevents their use. Also, 3.2 does not require the Responsible Entity to take any action other than scanning Removable Media at some point in time. Recommendation 3.7: Change "scan Removable Media outside of the BES Cyber System" to "use a method to scan Removable Media for malicious code and a procedure to respond to detected malicious code." Comment 3.8: CIP-010-2 – Attachment 2, Element 1.2: The second sentence under Element 1.2 is a restatement of Attachment 1, Element 1.2 and is not an example of evidence. Recommendation 3.8: Remove the second sentence under Attachment 2, Element 1.2: "The documentation must…" to keep the text in Attachment 2 focused on examples of evidence and not include requirements. Comment 3.9: Guidelines and Technical Basis for R4,

Attachment 1, Element 1.1: Inventories of Transient Cyber Assets is allowed by individual or group – individually or by asset type, therefore language under Element 1.1 should be consistent, allowing inventory of devices or device type. Recommendation 3.9: Add “or device types” to the second sentence: “pre-authorize and inventory of devices or device types or authorize devices or device types at the time of connection or use a combination of these methods.”
No
Comment 4.1: Transient Cyber Asset Definition: The “and” in the parenthesis after “A Cyber Asset,” is confusing. It could be interpreted as meaning a Cyber Asset must use all of these types of communication connections. Also, the parenthetical for the examples is misplaced; it refers to examples of communication types not Cyber Assets. Also, the definition makes it unclear whether a Transient Cyber Asset could also be a BES Cyber Asset or a Protected Cyber Asset and, therefore, unclear as to which requirements apply. For example, if a Responsible Entity defines a BES Cyber System to include a device, which could also be considered a Transient Cyber Asset, does the BES Cyber System requirements apply, the Transient Cyber Asset requirements, or both? Finally, “directly connected” may be interpreted as meaning only non-routable communications; however, we believe the intent is to include both routable and non-routable communications. Recommendation 4.1: Change the definition for Transient Cyber Asset to: “A Cyber Asset that is not included in a BES Cyber System and is not a Protected Cyber Asset (PCA) and is capable of transmitting executable code that is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth) for 30 consecutive calendar days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.” Also, if the intent is for the Transient Cyber Asset definition to apply to both routable and non-routable communications, clarify this in the Guidelines and Technical Basis for CIP-010-2.
Yes
The timeframes in the implementation plan are reasonable and appropriate; however, we have the following comment to help clarify a source of confusion among Responsible Entities: Comment 5.1: CIP-003-6, Attachment 1, Element 2 compliance date of April 1, 2018: According to the Implementation Plan, the Element 2 physical access controls must be applied to LEAPs by April 1, 2018; however, the LEAPs are identified under Element 3, which must be applied by September 1, 2018. This requires Responsible Entities to identify LEAPs before April 1, 2018, which may be unclear under the Implementation Plan. Recommendation: Clarify in the Implementation Plan that the LEAPs must be identified before April 1, 2018 in order to apply physical access controls to them by April 1, 2018.

The modification of CIP-003-6 R1 exceeds FERC's order to add "objective security controls" to R2 in the existing approved standard. The inclusion of item 1.2 in requirement R1 to create a cybersecurity policy adds an additional burden on Entities that have facilities with low impact BES Cyber Systems. The previous draft only required the documentation and implementation of cyber security plans under R2 that addressed the defined items. The additional compliance burden of creating and maintaining another policy document under R1 will not provide an appreciable increase in cyber security to the BES. The documentation and implementation of cyber security plans that include “objective criteria” to evaluate the sufficiency of an entity’s protections as ordered by FERC should be sufficient. AEP suggests the SDT revert to the original wording of R1 and add the "objective criteria" to R2. In CIP-003-6, Attachment 1 Item #2, the language is more prescriptive than the wording for Medium Impact BES Cyber Systems without External Routable Connectivity. AEP suggests the wording be modified to provide a level of flexibility for low impact BES Cyber Systems that is commensurate with their potential impact to the BES. For example, regarding physical security, it may be difficult to prove compliance with this section given the options provided. This may necessitate installing card readers on over 1,000 substations. AEP suggests removing the prescriptive bullet points, “Access controls; Monitoring controls; or Other operational, procedural, or technical physical security controls,” and similar prescriptive language. Separating the security controls into Attachment 1 and what appears to be a combination of examples, measures, and evidence into Attachment 2 in CIP-003-6 is confusing and a deviation from the formatting of the other CIP standards. AEP suggests that the wording be transferred to a table similar to the rest of the CIP standards. Regarding the CIP-003-6 R2 rationale “Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised,” aggregating Low Impact BES Cyber Systems across multiple assets does not reflect a true risk-based assessment. Rather, the existing Standard focuses on individual Assets that contain Low Impact BES Cyber Systems. FERC did not order a change in this philosophy. AEP suggests deleting this sentence.
No
The definitions create confusion where they refer to "asset" when it appears the term should be "facility." AEP suggests changing the second lowercase use of the word "asset" in each definition to be "facility."
No
Separating the security controls into Attachment 1 and what appears to be a combination of examples, measures, and evidence into Attachment 2 in CIP-010-2 is confusing and a deviation from the formatting of the other CIP standards. AEP suggests that the wording be transferred to a table similar to the rest of the CIP standards. AEP is concerned with the use of the term “security vulnerabilities,” which AEP believes is a broader term than, e.g., security

patch management or malicious code prevention utilized in CIP-007. AEP disagrees with the implication that a Responsible Entity would be required to mitigate “security vulnerabilities,” which may require Responsible Entities to monitor the National Vulnerability Database and address all vulnerabilities published over a day, week, month, or year where there are currently 65,268 security vulnerabilities. Large corporate networks are not able to address all security vulnerabilities in real time. How can this be expected on Transient Cyber Assets that may or may not have External Routable Connectivity? AEP suggests reverting to, e.g., security patch management or malicious code prevention rather than “security vulnerability mitigation.” This would align with the CIP-007 requirements and would be a more reasonable and manageable requirement. The existence of External Routable Connectivity should also be taken into consideration when revising this requirement to ensure the CIP standards treat devices commensurate with their risk profile. Element 3.2 of Attachment 1 is too restrictive. This presumes the scanning takes place on another system. The capabilities exist today to have embedded virus scan and encryption on USB drives. This should not require the scanning of the USB drive on a system outside the BES Cyber System as the scanning is taking place in real time by the applications running on the USB drive itself. Consider how this requirement relates to CIP-007 R3, where a Responsible Entity is required to “deploy method(s) to deter, detect, or prevent malicious code.” The methods deployed on a BES Cyber System would cover the threat of malicious code introduced via Removable Media. There is more than one layer of security controls that protects a BES Cyber System from the threat of malicious code introduced via Removable Media. Physical security, user account management, BES Cyber System software patch management, and BES Cyber System malicious code prevention, for example, are all required and would provide significant threat mitigation against the introduction of malicious code via Removable Media. The technology to prove compliance with the scanning requirement prior to connecting Removable Media to a BES Cyber System is not readily available. Systems are not equipped to provide the granularity as to what USB drive, CD/DVD, memory card, or floppy disk has been plugged into it. AEP suggests revising the requirement to allow the use of more advanced Removable Media with the ability to scan for malicious code during use without the burden of additional scanning requirements on external systems. Regarding Element 1.2 of Attachment 1, authorization and verification of users on Transient Cyber Assets is not practical when the Transient Cyber Assets do not have External Routable Connectivity or are not connected to a BES Cyber System with External Routable Connectivity. The authorization and verification of users, locations, and uses of Transient Cyber Assets without External Routable Connectivity would be a paper exercise with no technical means of enforcement or logging. As a result, without External Routable Connectivity, it is not possible to verify that the risks of Transient Cyber Assets were properly mitigated. This authentication would be a significant administrative burden with negligible reliability benefit (similar to those Requirements removed during the Paragraph 81 effort) when considering the significant number of BES Cyber Systems and Assets that will be in scope. AEP suggests that the element be modified to only require the authorization of users and approved transient hardware for the ESP accessible via a network to high or medium impact BES Cyber Systems with External Routable Connectivity. Regarding Element 2 of Attachment 1, vendors and contractors are not subject to CIP requirements themselves. A

Responsible Entity cannot force a vendor or contractor to adhere to the requirements of this element. Use of specialized vendor expertise and tools may be limited such that BES reliability would be impacted. Imposing this requirement on vendors and contractors is in fact more restrictive than medium impact BES Cyber Systems with External Routable Connectivity. AEP suggests removing Element 2 in its entirety.
No
Regarding Transient Cyber Assets, the 30 day timeframe prevents a Responsible Entity from being able to consider a device that is temporarily connected to the BES Cyber System as part of the BES Cyber System, and it is arbitrarily beyond what was ordered by FERC. AEP suggests removing the 30 day timeframe to reduce the amount of tracking Responsible Entities must do with respect to these devices.
No
AEP is concerned that the tiered approach to effective dates is overly complicated and will create confusion, especially for large entities. AEP suggests streamlining the implementation date to the latest date proposed in the Version X and Version 6 implementation plans.
Yes
While AEP supports this approach, AEP is also expecting that NERC and the regions will continue to implement the Reliability Assurance Initiative to embody the spirit of the "IAC" language. For example, AEP expects to continue to see self-logging privileges granted for lower risk items pursuant to the criteria set forth by the RAI.
Yes
AEP recommends that the drafting team not include a prescriptive approach in the proposed attachments in CIP-003 and CIP-010. Such prescriptive approaches unreasonably restrict the Responsible Entities from defining their own programs. For those items where the drafting team has proposed prescriptive approaches, AEP recommends removing them from an "Attachment" format and including them in tabular format as requirements similar to the remainder of the CIP Requirements without the prescriptive elements of the steps Responsible Entities are required to take. While AEP understands that this approach creates a baseline for cybersecurity in the industry, it is also concerned about the security of prescribing one approach for all companies within a critical infrastructure sector which could increase the likelihood of a successful attack across a broad front. AEP recommends including the exclusion from the defined term “Low Impact External Routable Connectivity” for transfer trip communications into the defined term “External Routable Connectivity.” Exclusion wording from LERC definition: “Communication protocols created for Intelligent Electronic Device (IED) to IED communication for protection and/or control functions from assets containing low impact BES Cyber Systems are excluded (examples of this communication include, but are not limited to, IEC 61850 GOOSE or vendor proprietary protocols).” There is no mandated timeframe to address the low impact and transient cyber device directives. AEP urges the SDT to take the time necessary to ensure that the requirements achieve the necessary reliability benefit and that there is broad-based industry support.

National Rural Electric Cooperative Association (NRECA)
In CIP-003-6, R2, it states “Note: An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required. Lists of authorized users are not required.” NRECA strongly supports this statement. In order to help registered entities to better understand how this “Note” can be used in demonstrating compliance, NRECA requests that the SDT explain and provide examples on how registered entities can comply with this standard without providing a list for audit purposes. NRECA requests that the SDT provide a detailed justification for the most recent additions of 4.6 and 4.7 to CIP-003-6, Attachment 1. These elements were not included in the first posting of the CIP V5 revisions and they have been added without adequate justification. These two new requirements add additional compliance and administrative burdens compared to the first posting without a demonstration of why they are needed for BES reliability. While NRECA will be voting in the affirmative, we expect the SDT will fully address why these requirements are needed for BES reliability. If this cannot be done, then 4.6 and 4.7 should be removed from Attachment 1.
Yes
Yes
Yes
While NRECA supports the proposed Implementation Plan, we request that the SDT consider syncing up deadlines for the physical and electronic access control requirements so that both are required by September 1, 2018.
Yes
NRECA supports the Version X package of revisions. However, we are very hopeful that the SDT can successfully complete revisions to CIP V5 that address FERC’s four directives by the Feb 2015 filing deadline. Having the four directives addressed by the filing deadline is critical to achieving a steady state for the CIP standards.
Yes
NRECA appreciates the efforts of the CIP V5 Revisions SDT in addressing this challenging project under very tight time constraints.

Almost all USB flash drives, mice, keyboards and other devices contain CPUs and software. Attackers can physically modified such devices to attack the computers to which the devices are connected - see http://www.theregister.co.uk/2011/06/27/mission_impossible_mouse_attack/ for an example. Worse, a malware-infected computer can compromise the software running in some kinds of connected USB devices - see http://www.wired.com/2014/10/code-published-for-unfixable-usb-attack/ for an example. Thus, a USB flash stick or other device whose firmware is compromised while connected to an external computer can cause BES Cyber Assets to malfunction when the USB drive is connected to those assets, either by loading malware on to the BES Cyber Asset, or by issuing incorrect mouse or keyboard commands to the asset. This suggests that USB devices generally should be considered BES Cyber Assets or Transient Cyber Assets, but the Removable Media definition gives USB flash drives as an example of Removable Media. The definitions and examples should make it clearer whether USB keyboards, mice, flash drives and other CPU & software-containing USB devices are BES Cyber Assets, Transient Cyber Assets, or Removable Media, and why those types of USB devices should be classified in this manner.

o Need definition modifications completed before voting YES. PacifiCorp also supports the comments of MidAmerican Energy Company regarding dispersed generation resources.
No
o LERC definition: The second sentence uses undefined terms that cause confusion and refers to specific technologies which over time will make the definition obsolete as technologies change. This exception also seems to remove protections indiscriminately rather than addressing the importance of the assets to be protected and finding ways to provide meaningful controls around them without impacting the effectiveness of the protocols in question.
No
o Attachment 1, Element 1.2: Recommend removing ‘Authorized’ because it adds requiring someone to approve/authorize these items. Entities would still be required to “specify” users, locations and use (individually or by group) for each part in Element 1.2. It also should be noted that the physical location that the Transient Device is approved for may not be as relevant as the logical network or cyber system that the Transient Device is used with (i.e. there may be multiple networks available at a particular location and which network it’s used on is more impactful to the Transient Device than the physical location itself). Consider changing element 1.2.2 to specify “network zones or cyber systems, either individually or by group, that the Transient Device may be used with.” o Attachment 1, Element 3.1: Recommend removing ‘Authorized’ because it adds requiring someone to approve/authorize these items. Entities would still be required to “specify” users and locations (individually or by group) for each part in Element 3.1.

TSGT feels that the “topics” of R1 should reflect the “elements” of Attachment 1 referenced in R2 unless there is a different meaning intended with the different wording. If so, please clarify the difference. One way to do this would be to simply refer to Attachment 1 under R1.2 and remove all the sub-requirements under R1.2.
Yes

Yes
No
TSGT believes that the recent revisions made to the Removable Media and Transient Cyber Asset definitions introduced some unintended ambiguity. Revisions should be made to make it clear what the assets/devices must be connected to, in order to clarify this qualifier of the definition. It is our understanding that the intent of the drafting team was to state "…directly connected… [clause]… to…", where the items after the "to" is what the "Cyber Asset" or "Media" is connected to. One simple solution is to add a comma after the [clause] and before the word "to". Another option is to state the [clause] part after the list of what the "Cyber Asset" or "Media" is connected to. Here is a suggested revision to how the definition for Removable Media might read: A Cyber Asset, directly connected to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset (e.g., using Ethernet, serial, Universal Serial Bus, and wireless including near field and Bluetooth communication) ; and connected for 30 consecutive calendar days or less, capable of transmitting executable code. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes.

SMUD agrees and supports the changes that were made to CIP-003-6, R2 including the use of Attachment 1 and Attachment 2. SMUD does suggest the following changes: The posted language in Attachment 1, Element 1 requires “Each Responsible Entity shall reinforce, once every 15 calendar months, its cyber security practices, using one or a combination of the following methods:…” Literal reading of this obligation means that entities are required to perform security awareness on a specific 15 month cycle. To align this obligation with that of CIP-004-5, R1, Part 1.1, SMUD requests the following edit: “Each Responsible Entity shall reinforce, at least once every 15 calendar months, its cyber security practices, using one or a combination of the following methods.” This establishes that the obligation of security awareness just needs to occur at least once over a 15 calendar month cycle. The posted language in CIP-003-6, R1, Part 1.2, Subpart 1.2.2 uses “Physical Security Controls” to define the policy obligation. However, in Attachment 1, Element 2, “Physical access controls” is used. SMUD recommends Attachment 1, Element 2 be changed to “Physical security controls” to be consistent with the language in CIP-003-6, R1. Additionally, edit all other references (e.g., CIP-003-6 Attachment 2, Guidelines and Technical Basis, and RSAWs). The posted language in Attachment 1, Elements 2, 4, and 3.1 do not use the acronyms for Low Impact BES Cyber System Electronic Access Point or for Low Impact External Routable Connectivity. SMUD

recommends that the acronyms “LEAP” and “LERC” be used after each of their defined terms. The posted language in Attachment 1, Element 4, Part 4.7 requires that the Cyber Security Incident Response Plan be updated “within 180 days” of a test or actual incident. SMUD recommends add “if necessary” after “within 180 days.” It is possible that no updates are actually needed to the plan following either event and it should not be necessary for entities to update a document unless there is a need to make improvements. The posted language in Attachment 2, Examples of Evidence for Element 2 provides card key and special locks as examples of physical security controls; however, the Guidelines and Technical Basis for Element 2 states, “entities may utilize perimeter controls (e.g., fences with locked gates, guards, site access policies, etc.) and/or more granular areas of physical access control.” SMUD recommends including “perimeter controls” under Attachment 2, Element 2 as an example “(e.g. card key, special locks, perimeter controls)” for consistency. The posted language in Attachment 1, Element 3, requires the use of a Low Impact BES Cyber System Electronic Access Point (LEAP) if there is Low Impact External Routable Connectivity (LERC). The definition of a LEAP is the “interface” of the device that “allows” the LERC. SMUD recommends that the Guidelines and Technical Basis for Attachment 1 where LEAP is described be updated to include statements that the LEAP can be implemented within the same Cyber Asset that is serving the function of an EACMS or EAP designated for a high impact or medium impact BES Cyber System. This is acceptable because regardless of the impact rating, it is the “interface” that is in scope. It is not the intent to require entity’s to have two separate physical Cyber Assets for either access point implementation. Potential for Multiple violations: SMUD has some concern that in a multi-impact rated program (high, medium and low), any failure to fulfill a requirement, such as Attachment 1, Element 1 Cyber Security Awareness or Element 4 Cyber Security Incident Response could result in violation of CIP-003-6, R2 as well as CIP-004-5, R1 and CIP-008-5. Potential compliance and enforcement implications should not dictate the structure of the standards nor an entity’s compliance program. An entity should be allowed to determine, in a form most efficient and effective to the entity, the best approach in fulfilling the security requirements. Please offer reassurance that the currently proposed structure with CIP-003-6, R2 does not create a potential situation for multiple violations. Confirmation from NERC Compliance will be important to reassure industry. Can NERC Compliance explain how this issue would be addressed under the Reliability Assurance Initiative?
Yes
SMUD supports the new definitions for Low Impact External Routable Connectivity and Low Impact BES Cyber Systems Electronic Access Point. SMUD appreciates the development of new definitions to simplify the language in the requirement. SMUD does suggest the following minor changes to the definitions for clarity: The posted language for the Low Impact BES Cyber System Electronic Access Point (LEAP) definition uses “allow” in regards to Low Impact External Routable Connectivity (LERC), SMUD recommends using the word “controls” to be specific that it is the intent of the interface of the LEAP to control the communication inbound and outbound for the asset(s) containing the low impact BES Cyber System.
Yes

SMUD agrees and supports the changes that were made to CIP-010-2, R4; including the use of Attachment 1 and Attachment 2. SMUD does recommend a few edits for clarity: The posted language for Attachment 1, Element 2.3 requires, “Responsible Entities shall determine whether additional mitigation measures are necessary…” which is intended to ensure that entity’s make an affirmative decision to allow the device to connect. SMUD recommends adding “if necessary” after “additional mitigation actions” for clarity to ensure that entities can accept the device without requiring modifications. The posted language for the Transient Cyber Assets in Attachment 1, Element 1 allows for authorization to be done individually or by asset type; however the Guidelines and Technical Basis for Element 1 does not discuss the ability to authorize based on a group of assets. SMUD recommends language be added to allow “authorization individually or by groups of assets” to the Guidelines and Technical Basis for Element 1.1.
Yes
SMUD agree with the changes that were made by the SDT to both Transient Cyber Assets and Removable Media definitions. However, SMUD is concerned with starting the definition of Removable Media with the capitalized “Media” considering that “Media” is itself not a defined term. SMUD recommends an edit to resolve this concern: “Removable Media: One or more media”, directly connected for 30 consecutive calendar days or less, capable of transmitting executable code to: (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset that can be used to store, copy, move, or access data. Removable Media are not Cyber Assets. Examples include, but are not limited to, floppy disks, compact disks, USB flash drives, external hard drives, and other flash memory cards/drives that contain nonvolatile memory.
Yes
Comments: SMUD agrees and supports the proposed implementation plan deadlines for CIP-003-6, R2. SMUD appreciates that the SDT has provided a tiered approach to the implementation of physical security and electronic access controls. SMUD believes that even with the tiered approach to the implementation plan, entities are not restricted from implementing both controls in parallel. Considering the diverse nature of the facilities and systems, SMUD believes the additional compliance time as well as the tiered approach provides entities the needed flexibility to evaluate their physical security and system capabilities to effectively apply the new requirements. There are possibilities that physical modifications will need to be made to facilities to deploy the necessary controls to restrict physical access. Additionally, to deploy a Low Impact Electronic Access Point, it is possible that certain systems or computer network architectures may need to be modified to accommodate the addition of an access point.
Yes
SMUD supports the removal of the IAC language from the 17 requirements and the continued work by NERC to develop the Reliability Assurance Initiative.
Yes
SMUD appreciates NERC's work on the development of the RSAWs related to CIP Version 5 and Revisions. SMUD is concerned that the RSAWs have not sufficiently incorporated the

specific language of the standards or the measures. It is unclear from reading the currently posted RSAWs how auditors will use the measures to inform the Compliance Assessment Approach.

The revised structure of the CIP-003-6 is an improvement for the low requirements. However, some concerns remain. We find the new LERC definition needs clarification. Therefore we must vote no on the requirements that reference the definition. //Attachment 1, Element 2 - The placement of the phrase “based on need” with the commas in the statement may cause differences in interpretation. **Recommendation - Remove “based on need” from the requirement and the guidelines and technical basis because it is creating a more restrictive requirement for lows than for medium BES Cyber Assets that don’t have external routable connectivity. For those medium impact BES Cyber Assets, CIP-006-5 R1.1 requires entities to “restrict physical access,” without requiring ‘authorization’ or ‘based on need.’ // Attachment 1, Element 4 - Cyber incident response – 4.6 record retention was added with draft 2. It is unclear why. This is a ‘documentation only’ requirement and is duplicative to the record retention in Compliance Monitoring section C of every standard. **Recommendation – Remove this requirement. // Att. 1 – Element 4 Cyber incident response – 4.7 plan update. We find no support for the 180 day limit. Given the scale of lows, there could be multiple 180-

day clocks to track. While it's important to keep plans current, triggering updates for lows for discrete incidents is administratively burdensome compared to the risk. **Recommendation - At least once every 15 calendar months, review the Cyber Security Incident response plan(s) (unless the plan(s) have already been reviewed under CIP-008) and update, if needed. Note: We're concerned about double jeopardy for entities that leverage their COP-008 plan(s). // As with MidAmerican Energy Company's draft one comments, we recommend addressing dispersed generation with respect to the CIP-003-5 R2 requirements for low impact BES Cyber Systems. The dispersed generation SAR scope is to make it clear "what, if any, requirements should apply to dispersed generation … Unless this clarity is provided applicability at a finer level of granularity related to dispersed generation may be seen as required and such granularity will result in activities that have no benefit to reliable operation of the BES. Furthermore applicability at a finer level of granularity will result in unneeded and ineffective collection, analysis, and reporting activities that may result in a detriment to reliability." Standards under revision "should be examined and revised, as needed, to ensure it is clear that these activities and reporting are conducted at the point of aggregation to 75 MVA, and not at an individual turbine, inverter or unit level for dispersed generation." ** We recommend the CIP and dispersed generation drafting teams continue to collaborate to clarify the applicability of CIP-003-5 R2 for low impact BES Cyber Systems for dispersed generation. Where a Registered Entity can demonstrate that a dispersed generation low BES Cyber System cannot adversely impact 75MVA or more within 15 minutes, the R2 requirements should not apply to the dispersed generation low impact BES Cyber System. The burden of proof is on the Registered Entity. The requirements apply if the Registered Entity cannot meet the burden of proof. Appropriate text could be added to the R2 requirement.
No
The LERC definition is not clear. The second sentence uses undefined terms and refers to specific technologies, which over the time will make the definition obsolete as technologies change. The use of capital letters for Intelligent Electronic Device creates confusion by suggesting it is a glossary term. The exclusion is not present for medium or high impact. Explain the difference. // 'Background' in the 'Applicability' section for CIP version 5 of standards 004 through 007, includes the following: "This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity." Is this relevant for low impact BES Cyber Systems? If so, should it be included in CIP-003-6?
No
The revised structure of the CIP-010-2 and many of the revisions are an improvement for the transient devices requirements. However, some concerns remain. As with draft 1, use of the word 'Authorized' requires an additional level of documentation, which is more burdensome given the scale of low impact BES Cyber Systems. **Recommendation - Remove 'Authorized.' Entities would still be required to "specify" users, locations and use (individually or by group) for each part in Element 1.2 and 3.1 to meet the FERC directive. // Att. 1 – Element 2 Vendor/contractor owned or managed – 2.3 - The intent of this requirement is clear in the guidelines and technical basis, but not in the words of the requirement. The requirement could be interpreted such that Responsible Entities shall determine whether additional mitigation actions are necessary for any (and all) of the methods specified (listed) in 2.1 and

2.2, not just the ones that were selected. Clarification is needed in the requirement, not just in the guidelines and technical basis. // Guidelines and Technical Basis for R4 Att. 1 Element 1.1 - Insert “type” with references to devices. For example, “…pre-authorize an inventory of devices or device types; or authorize devices or device types at the time….”
Yes
No
The implementation plan requires physical access controls for lows by April 1, 2018. These controls are to be applied to LEAPs, which based on the implementation plan, aren’t required to be identified until September 1, 2018, with the electronic access controls. We propose making them both the same date – September 1, 2018, to minimize confusion. However, we would prefer to keep the dates staggered if synchronizing the dates would make the implementation date April 1, 2018, for both of them.
Yes
We support removal of the IAC language with the understanding that compliance exceptions and other elements of the Reliability Assurance Initiative will be implemented in all regions in January 2015.
Yes
MidAmerican Energy Company thanks the Standard Drafting Team for commitment of their time and expertise to the development of these CIP version 5 revisions.

Additional Comments

SPP RE

Bob Reynolds

1. For the requirements applicable to Low Impact assets, the Standard Drafting Team (SDT) changed the structure of CIP-003-6, Requirements R1 and R2 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-003-6 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No: X

   Comments: (1) The wording of element 2 (physical controls) has an issue – the phrase “based on need…” is misplaced and should be modified to appear earlier in the sentence. The SPP RE recommends the sentence be modified to read as follows: “Physical access controls: Each Responsible Entity shall, based on need as determined by the Responsible

Entity, implement controls to restrict physical access to (1) the asset or the locations of the low impact BES Cyber Systems within the asset, and (2) the Low Impact BES Cyber System Electronic Access Point, if any, through one or more of the following:" (2) Element 4.6, which requires record retention related to Reportable Cyber Security Incidents, is nonsensical as written. The requirement should establish a minimum expectation; otherwise the Responsible Entity could declare a one-second retention period and the auditor would have no option except to find compliance. (3) Element 4.7, allowing 180 calendar days to update an incident response plan, is excessive and unreasonable. Updating the plan in the same time frame as that for High and Medium impact BES Cyber Systems is not unreasonable given the importance and the anticipated very broad application of the requirement. (4) The Guidelines and Technical Basis for Requirement R2 states that monitoring does not imply logging. At issue is how the Responsible Entity can demonstrate an effective monitoring process if unauthorized attempted or actual access is not recorded in some fashion.

2. The SDT proposed new definitions **Low Impact External Routable Connectivity** and **Low Impact BES Cyber System Electronic Access Point** to clarify the requirement language in CIP-003-6. Do you agree with the proposed new definitions? If not, please offer suggested revisions.

   Yes:

   No: X

   Comments: The SPP RE agrees with the definition of Low Impact External Routable Connectivity (LERC). SPP RE does not agree with the definition of Low Impact BES Cyber System Electronic Access Point (LEAP) with respect to the statement that allows the LEAP to be placed at an external location. This might not be an issue if the communication circuits between the LEAP and the protected BES Cyber Systems are private and managed by the Responsible Entity. When the communication circuits are over public Wide Area Networks using third-party service providers, placing the LEAP on the other side of the public network circuits provides minimal protection and exposes the protected assets to the risk of unauthorized access.

3. For the requirements applicable to transient devices, the SDT changed the structure of CIP-010-2, Requirement R4 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-010-2 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No: X

   Comments: (1) Element 1.4 should also include a requirement to ensure any removable media, such as a USB flash drive, is also externally scanned for malware before use with the Transient device. Element 3.2 implies such scanning is only necessary if the removable media is to be used with the BES Cyber System. (2) Any dependence upon the review of a

vendor policy or process, as permitted by Elements 2.1 and 2.2, needs to include a step to confirm the policy or process has been implemented for the transient device.

4. The SDT revised the proposed new definitions for Transient Cyber Assets and Removable Media to address issues raised in stakeholder comments. Do you agree with the proposed definitions? If not, please offer suggested revisions.

   Yes:

   No: X

   Comments: (1) The SPP RE again urges the Standards Drafting Team to eliminate the less than 30 day usage period found in the definition of Transient Cyber Asset, and require instead that the transient device be disconnected from the BES Cyber System or network immediately when its intended temporary use is complete and to remain disconnected until the next temporary use is required. Otherwise, a Responsible Entity could essentially maintain a routine, long-term network connection with only momentary connection breaks and thus bypass the security controls imposed on BES Cyber Assets that are normally connected for the long term. (2) The 30-days or less qualification in the Removable Media definition is unnecessary and may preclude the use of removable media containing authentication (e.g., digital certificates) or license (e.g., PSS/E dongle) information.

5. In response to stakeholder comments, the SDT revised the implementation deadlines. The implementation plan now includes tiered deadlines for the aspects of CIP-003-6. The CIP-007-6 timeframe is now consistent with CIP-006-6. Are these timeframes reasonable and appropriate? If not please explain specifically which implementation plan item needs adjusting and include the rationale for the suggested change.

   Yes: X

   No:

   Comments:

6. The results of the initial CIP V5 Revisions ballot showed industry support for the new Communication Networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015. Meanwhile, the CIP-003-6 and CIP-010-2 revisions proposed to address the Low Impact and Transient Devices directives did not pass initial ballot.

   In order to separate approval of the IAC and Communication Networks revisions from the Low Impact and Transient Device revisions where they occur within the same standard, the relevant standards are posted separately. This separate posting provides additional options to meet the FERC filing deadline of February 3, 2015 in the event Low Impact or Transient Device revisions do not obtain industry approval in the current ballot. (Please see explanatory document on the CIP Version 5 Revisions project page for more information)

Do you support removal of the IAC language from the 17 Requirements across CIP Version 5 Standards? If not, please explain why.

Yes: X

No:

Comments:

7. Do you have input not discussed in the questions above on other areas relative to the revisions made to the standards or implementation plan since the initial posting and within the scope of the Standards Authorization Request? If so, please provide them here, recognizing that you do not have to provide a response to all questions.

   Yes:

   No: X

   Comments:

Calpine Energy
Hamid Zakery

Calpine agrees with removing " identify, access, and correct" from the standards for High and Medium impact categories but recommend keeping " identify, access, and correct" for Low impact category.

Austin Energy
Thomas Standifur

1. For the requirements applicable to Low Impact assets, the Standard Drafting Team (SDT) changed the structure of CIP-003-6, Requirements R1 and R2 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-003-6 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No: X

   Comments: Recommend the requirements for physical security of low assets be deleted. This requirement is repetitive of safety requirements in the National Electrical Safety Code (NESC), Section 11 - Protective arrangements in electric supply stations, paragraph 110

General requirements. The NESC includes requirements to protect the public from high voltages. The safety aspects of the NESC are more stringent than the requirements in the proposed NERC standard and public safety is a higher concern than the less likely occurrence of security concerns at a low impact asset. Specifically the proposed CIP-003-6 requires:

The proposed NERC requirement allows technical physical security controls to restrict physical access to both. A fence with a locked gate, which is required by the NESC appears to meet the proposed NERC requirement to restrict physical access to both the asset and the cyber asset. The other suggestions in the draft standard could be provided in a best practices document. The requirement for physical security of low assets should be deleted.

2. The SDT proposed new definitions **Low Impact External Routable Connectivity** and **Low Impact BES Cyber System Electronic Access Point** to clarify the requirement language in CIP-003-6. Do you agree with the proposed new definitions? If not, please offer suggested revisions.

   Yes:

   No: X

   Comments: The LERC should specifically exclude communications aided relaying used for pilot relaying protection. Also, there is a high risk of confusion when using technical jargon in NERC definitions. Both of these definitions fall within this high level of confusion. If a national reliability standard requires too much technical jargon, it is written at the wrong level for its purpose. The reliability standard should be written to avoid the use of these definitions.

3. For the requirements applicable to transient devices, the SDT changed the structure of CIP-010-2, Requirement R4 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-010-2 Attachment 1? If not, please explain your objections and offer suggested revisions.

   Yes:

   No: X

   Comments: While the language in the proposed requirements is a good practice, it creates significant compliance burden for entities to maintain documentation to prove compliance; plus, additional resources will be required to implement compliance controls that yield minimal risk reduction for the reliability of the BES. Transient devices will be a source of possible violations in future internal compliance reviews for self reports and also compliance audits. Section 1.2 of Attachment 1 is not needed and should be removed. Requirements already exist for anyone having access to protected cyber systems. Section 1.2 puts an entity in double jeopardy of violating multiple requirements for one action. The same comments apply to section 3.1 of attachment 1 and this requirement should be removed.

4. The SDT revised the proposed new definitions for Transient Cyber Assets and Removable Media to address issues raised in stakeholder comments. Do you agree with the proposed definitions? If not, please offer suggested revisions.

   Yes:

   No:

   Comments:

5. In response to stakeholder comments, the SDT revised the implementation deadlines. The implementation plan now includes tiered deadlines for the aspects of CIP-003-6. The CIP-007-6 timeframe is now consistent with CIP-006-6. Are these timeframes reasonable and appropriate? If not please explain specifically which implementation plan item needs adjusting and include the rationale for the suggested change.

   Yes:

   No:

   Comments:

6. The results of the initial CIP V5 Revisions ballot showed industry support for the new Communication Networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015. Meanwhile, the CIP-003-6 and CIP-010-2 revisions proposed to address the Low Impact and Transient Devices directives did not pass initial ballot.

   In order to separate approval of the IAC and Communication Networks revisions from the Low Impact and Transient Device revisions where they occur within the same standard, the relevant standards are posted separately. This separate posting provides additional options to meet the FERC filing deadline of February 3, 2015 in the event Low Impact or Transient Device revisions do not obtain industry approval in the current ballot. (Please see explanatory document on the CIP Version 5 Revisions project page for more information)

   Do you support removal of the IAC language from the 17 Requirements across CIP Version 5 Standards? If not, please explain why.

   Yes:

   No: X

Comments: As stated in previous comments, we do not support the removal of the IAC language. Removal of the IAC language is a return to zero tolerance and RAI does not magically make a violation disappear. Our suggestion is to delete any requirement from the standard that contains IAC language. This is our opportunity as an industry to remove the sections, develop better language as FERC allowed, or face multiple violations of these zero tolerance requirements for many years. We've rushed through all the previous versions to meet a deadline. This is the time to work on a solution and get a better standard. We are working to meet compliance deadlines for version five standards while making changes to the standards – this can't be a good practice. FERC approved the version five standards; they didn't remand

them back. We have an official compliance date to meet for version five. Worse case, let's use the IAC language as currently approved.

7. Do you have input not discussed in the questions above on other areas relative to the revisions made to the standards or implementation plan since the initial posting and within the scope of the Standards Authorization Request? If so, please provide them here, recognizing that you do not have to provide a response to all questions.

   Yes: X

   No:

   Comments: The NERC CIP standards have resulted in numerous violations to registered entities and have been difficult to implement. These standards must get to a steady state and changes to the standards should be limited to an absolute minimum.

Consideration of Comments: Project 2014-02 CIP Version 5 Revisions

The Project 2014-02 Standard Drafting Team (SDT) thanks all commenters who submitted comments on the draft Critical Infrastructure Protection (CIP) Reliability Standards. These Reliability Standards were posted for a 45-day public comment period from September 3, 2014 through October 17, 2014. Stakeholders were asked to provide feedback on the Reliability Standards and associated documents through a special electronic comment form. There were 70 responses, including comments from approximately 164 different people from approximately 117 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

This consideration of comments is responding to the comments received on the standards and implementation plan balloted as CIP-003-6 and CIP-010-2 during the additional comment period and ballot. These standards included revisions to address the low impact and transient devices directives. There was a concurrent 45-day comment period and ballot of the Version X standards and implementation plan that addressed only the identify, assess, and correct (IAC) and communication networks directives. The SDT's responses to comments on those revisions are available here.

All comments submitted may be reviewed in their original format on the CIP Version 5 Revisions SDT project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, please contact Valerie Agnew, the Director of Standards, at 404-446-2566 or valerie.agnew@nerc.net. There is also a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process can be found in the Standard Processes Manual.
http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Introduction

The SDT appreciates industry comments on the revisions to the CIP Reliability Standards. During the development of the revised standards prior to posting, the SDT made it a priority to conduct outreach as modifications were made to the standards. The SDT conducted three face-to-face meetings to revise the standards, Implementation Plan, Violation Risk Factors (VRFs), and Violation Severity Levels (VSLs) in order to appropriately consider all comments received. The SDT continued its rigorous conference call schedule as it understands the importance of getting these standards to steady state.

Background

On November 22, 2013, FERC issued Order No. 791, Version 5 Critical Infrastructure Protection Reliability Standards. In this order, FERC approved version 5 of the CIP standards and also directed that NERC make the following modifications to those standards:

1. Modify or remove the "identify, assess, and correct" (IAC) language in 17 CIP version 5 requirements.
2. Develop modifications to the CIP standards to address security controls for to assets containing low impact BES Cyber Systems.
3. Develop requirements that protect transient electronic devices.
4. Create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

FERC directed NERC to submit new or modified standards responding to the directives related to the IAC language and communication networks by February 3, 2015, one year from the effective date of Order No. 791. FERC did not place any time frame for NERC to respond to the low impact and transient electronic devices directives. The purpose of the proposed project is to address the directives from FERC Order No. 791 to develop or modify the CIP standards.

Question 1: CIP-003-6

1. *For the requirements applicable to Low Impact assets, the Standard Drafting Team (SDT) changed the structure of CIP-003-6, Requirements R1 and R2 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-003-6 Attachment 1? If not, please explain your objections and offer suggested revisions.*

Placement

Several stakeholders commented on the placement of the low impact requirements in the CIP suite of standards. Tennessee Valley Authority (TVA), New York Power Authority, and Iberdrola USA commented that they preferred the low impact requirements in the relevant CIP standard rather than as a plan in CIP-003. American Electric Power (AEP) and Independent Electricity System Operator (IESO) suggested the SDT place the requirements in a table format similar to other CIP standards. However, Exelon, Edison Electric Institute (EEI), Southern Companies, MidAmerican Energy Company, NV Energy, Consumers Energy Company, FirstEnergy, Colorado Springs Utilities, Occidental Chemical Corporation, Pepco Holdings, Sacramento Municipal Utility District (SMUD), Bonneville Power Administration (BPA), and ACES Standards Collaborators expressed support for the current CIP-003 plan structure for low impact requirements.

The SDT appreciates the comments regarding the placement of the low impact requirements and determined to retain the current CIP-003 plan structure due to a majority of stakeholder support.

Attachment 1

Several commenters suggested revisions to the sections included in Attachment 1 to CIP-003-6, Requirement R2. Please note that the SDT changed the term "element" to "section" in response to several comments so the remainder of this document will use "section" even if commenters referred to "element."

For section 1, NIPSCO, EEI, Oncor Electric Delivery Company LLC, Iberdrola USA, NV Energy, FirstEnergy, and Pepco Holdings suggested that the SDT make Attachment 1 language consistent with Attachment 2 by using "through one or more of the following" and labeling Attachment 1 sections similar to Attachment 2. Dominion also commented that Attachment 1 should be consistent with Attachment 2. Exelon suggested that the SDT relocate the bullets from the requirement in Attachment 1 to the measures in Attachment 2. Exelon further commented that the SDT should remove "its" because it is more prescriptive than CIP-004-6, Requirement R1. Massachusetts Municipal Wholesale Electric Company (MMWEC), Colorado Springs Utilities, Indiana Municipal Power Agency (IMPA), SMUD, BPA, and Florida Municipal Power Agency (FMPA) recommended changing "once every 15 calendar months" to "at least once every 15 calendar months." In response to these comments, the SDT changed the word "element" to "section" throughout the standard, moved the bullets from the requirements language to the measures, removed "its" as suggested, and revised the requirement to read "at least once every 15 calendar months."

For section 2, Dominion, MMWEC, MidAmerican Energy Company, MRO NERC Standards Review Forum, and Luminant Generation Company commented that "based on need" should be removed. SPP-RE commented that the phrase "based on need" should be moved to earlier in the sentence. Dominion, NIPSCO, EEI, Oncor, Southern Companies, Iberdrola USA, NV Energy, FirstEnergy, Pepco Holdings, SMUD, BPA, and IMPA recommended that the SDT ensure that the terms for physical controls are consistent between attachments and suggested using the term "physical security controls."

The SDT revised CIP-003-6, section 2 to clarify that the Responsible Entity is obligated to "control physical access" at the asset or location containing the low impact BES Cyber System. The SDT moved, but retained, the phrase "based on need" so that criteria are established by which to control access. The need for access is to be

"determined by the Responsible Entity" to accommodate facts and circumstances relevant to the location. This revision addresses the FERC Order No. 791 directive to add objective criteria or specificity to the requirement.

Note, in response to other comments, the SDT changed "access" to "security" and "to restrict" to "control" and made the suggested change to "physical security controls."

Dynegy suggested that the SDT use "or" rather than "and" in section 2 and commented that an inventory is required if the language used "and." The SDT appreciates the comment. The SDT used "and" to restrict access to both the asset/location of the BES Cyber System and the LEAP should it reside outside of the asset/location. Entities would need to physically protect two spots if they were separate. The graphics in the guidance shows this scenario for electronic access. If the LEAP is located within the asset containing the low impact BES Cyber System, the entity would need to show how the asset containing both the LEAP and the low impact BES Cyber System is protected. It is still one obligation to show how physical access controls are being applied to either item. The intent of the language is for an entity to have an inventory of the LEAPs, but not inventories of low impact BES Cyber System(s) and their individual Cyber Assets.

Nebraska Public Power District (NPPD) recommended that section 2 requirements for physical security be deleted and the vulnerabilities are covered by national Electrical Safety Code, Section 11. The SDT thanks you for the comments. CIP-003-5 incorporated physical security obligations for assets/locations with low impact BES Cyber Systems into the suite of requirements under the NERC purview. FERC approval of CIP V5 and the Order No. 791 directives obligate the drafting team to retain the physical security requirements.

AEP and Xcel Energy commented that section 2 is more prescriptive than medium impact without External Routable Connectivity and would be a compliance burden. The SDT revised CIP-003, section 2, and removed some of the specific list of physical security controls. Section 2 retains "based on need" as a qualifier to physical security controls, but it's used to make the section objective clear.

For section 3, TVA commented that establishing a LEAP assumes an ESP which is subject to CIP-005-5, Requirement R1 with inbound and outbound access subject to CIP-007-6, Requirement R1. The SDT thanks you for your comment. The requirements for low impact BES Cyber Systems are contained solely within CIP-003-6, R2. No other CIP standards related to high and medium impact BES Cyber Systems apply.

EEI, Oncor, Southern Companies, Iberdrola USA, FirstEnergy, Pepco Holdings, SMUD, BPA, IMPA, Entergy Services, and American Public Power Association (APPA) commented that the LERC and LEAP acronyms were missing from sections 2 and 3. The SDT added the acronyms where appropriate in the requirement.

For section 4, Dominion, CenterPoint Energy Houston Electric, EEI, NIPSCO, Oncor, Southern Companies, Iberdrola USA, NV Energy, Consumers Energy Company, Xcel Energy, MRO NERC Standards Review Forum, FirstEnergy, Pepco Holdings, and Luminant Generation Company suggested that the SDT add "if needed" to the requirement to update the Cyber Security Incident response plan(s). Exelon requested that the SDT clarify the intent of the phrase "either by asset or groups of assets" to confirm whether enterprise-wide plans could fulfill the obligations. Exelon, MidAmerican, and NRECA requested that the SDT justify the addition of 4.6 and 4.7 and the 180-day clock because it could cause entities to maintain multiple clocks for different impact levels. SPP-RE commented that the record retention requirement in Section 4.6 does not make sense and recommended that the requirement establish a minimum expectation. SPP-RE further commented that the updates for Section 4.7 take place at the same frequency as that of medium and high impact BES Cyber Systems.

The SDT confirms that the phrase "either by asset or by groups of assets" accommodates use of an enterprise-wide plan for multiple assets or locations to fulfill the obligation. The SDT added language to the guidelines to emphasize the point. The SDT removed 4.6; however, retained 4.7. The SDT finds the updating of the Cyber

Security Incident response plan following a test or actual Reportable Cyber Security Incident to be a valuable security step, if updates are needed. The SDT added "if needed" in recognition that updates may not always be needed. The SDT retained the "180 calendar days" time period for updates. This is a reasonable amount of time to make updates. Entities may make the updates sooner ("within 180 calendar days") if preferable for their program.

MMWEC suggested changing identification, classification, and response to Cyber Security Incidents to identification and classification because response is a subset of incident handling. In addition, MMWEC commented that because the testing is every 36 months, entities should be required to ensure individuals are aware of their response roles through more frequent training or review their responsibilities. Consider review roles at least once every 15 calendar months. The SDT thanks you for your comments. In the initial comments, stakeholders preferred a closer alignment between the CIP-008 and the CIP-003 elements to help accommodate entities that will have multiple impact levels. Given the risk, the SDT thinks 36 months is appropriate.

Northeast Power Coordinating Council (NPCC) requested clarification where dividing line is between section 4 and EOP-004. The SDT notes that EOP-004-2 does not cover the reporting of Cyber Security Incidents. Entities may choose to use the same plan used for EOP-004-2 for Reportable Cyber Security Incidents.

Lincoln Electric System and Consumers Energy Company commented that section 4 is virtually identical to CIP-008-5 for medium and high impact BES Cyber Systems and noted that the requirement would be burdensome for low impact without External Routable Connectivity. The SDT removed 4.6 to reduce the burden. The requirement allows Responsible Entities to use an enterprise Cyber Security Incident response plan and not develop individual by asset or device to also reduce the burden.

Texas Reliability Entity (TRE) recommended that additional elements be added to CIP-003 regarding low impact to reduce the risk to high and medium impact assets: information protection, recovery functions, system security functions, and configuration change management. The SDT thanks you for the comments. The SDT considers the controls for low impact BES Cyber Systems to be appropriate to their level of risk to the Bulk Electric System.

Entergy Services suggested that the SDT align the electronic access controls with the physical access controls to provide entities latitude. The SDT thanks you for the comments. The SDT considers the controls for low impact BES Cyber Systems to be appropriate to their level of risk to the Bulk Electric System.

Exelon expressed support of the standalone nature of the requirements in sections 2 and 3 and states they are consistent with medium and high impact requirements but tailored to lows. The SDT thanks you for the comment.

Kansas City Power and Light and BC Hydro commented that the protections are too detailed and excessive and represent too large a pool of assets that do not have a substantive impact to the Bulk Electric System. The SDT thanks you for the comments. The SDT considers the controls for low impact BES Cyber Systems to be appropriate to their level of risk on the Bulk Electric System.

Attachment 2

TVA commented that Attachment 2 does not offer much clarity beyond what is already documented in Attachment 1 and examples of evidence should be documented in table format. The SDT thanks you for your comments but notes that it received support of the details outlined in Attachment 2.

Dominion, NIPSCO, EEI, Oncor, Southern Companies, Iberdrola USA, Xcel Energy, SMUD, BPA, APPA, and IMPA commented that section 2 of Attachment 2 did not include "perimeter controls" like the guidelines and suggested section 2 include it. The SDT added "perimeter controls" to Attachment 2 as recommended.

MMWEC suggested that the SDT change "(e.g. IP addresses, ports, services) to "(e.g. by restricting IP addresses, ports, and/or services)" and to move the phrase following "deems necessary." The SDT added the text "(e.g. by restricting IP addresses, ports and/or services)" as recommended.

List of Assets

TVA commented that the CIP-003-6 Guidelines that say "using the list of assets from CIP-002" contradicts CIP-002-5.1, Requirement R1, Part 1.3 which states "a discrete list of low impact BES Cyber Systems is not required." Exelon Companies, Idaho Power, Xcel Energy, and NRECA requested the SDT to discuss how to demonstrate compliance without a list of Systems and suggested the SDT add guidance on the note in the requirement.

The SDT notes that the list of assets containing low impact BES Cyber Systems from CIP-002-5.1 ("Part 1.3 list") is different from a discrete inventory of low impact BES Cyber Systems and the Cyber Assets that make up the low impact BES Cyber System ("cyber list"). The Part 1.3 list of generation plants, substations, control centers, etc. must be maintained and provided at audit. The cyber list; however, is not required. A cyber list would encompass every Cyber Asset in every BES asset across the NERC region. The SDT determined and FERC supports in Order 791, the effort to flawlessly maintain the cyber list over the audit period at each BES asset does not match the level of risk.

The items in CIP-003-6 Attachment 1 were written to be assessed at a physical asset containing low impact BES Cyber System(s) site level. The cyber security policies, awareness program, and incident response plan can be assessed through the assessment of the documented processes. The physical security controls can be assessed at the site level. The electronic access controls were developed to focus protection on the presence of Low Impact External Routable Connectivity (LERC) and establishing boundary protection with LEAP(s), if any. It is intended that entities will have an inventory of LEAPs, if any, but not a cyber list of the individual low impact BES Cyber System(s) Cyber Assets. An assessment may spot-check an asset containing low impact BES Cyber System(s) site to determine whether the cyber security plan(s) meets the objectives of the physical security controls at the asset containing the low impact BES Cyber Systems and whether LERC exists and LEAPs are properly established. However, a Cyber List of the low impact BES Cyber System(s) or their associated Cyber Assets is not required to perform this assessment.

Other

TVA commented that the Violation Severity Levels (VSLs) for CIP-003, Requirement R2 are in the Severe category but apply to low impact systems. The SDT notes that VSLs do not measure risk but the level of violation of the requirement. The VSL construct indicates that a binary VSL would use the Severe column. In addition, the VRF assesses risk, and the requirement's VRF is Lower.

TRE recommended replacing "its" with "a Responsible Entity's" in the Rationale of Requirement R1. The SDT replaced "its" with "a Responsible Entity's" per the recommendation.

Lincoln Electric System recommended replacing the term Bulk-Power System with Bulk Electric System in the Rationale of Requirement R2. The SDT replaced Bulk-Power System with Bulk Electric System as recommended.

Dominion suggested revising the Requirement R2 guidance to state, "The SDT is balancing the fact that low impact BES Cyber Systems are indeed low impact to the BES, but they do still meet the definition of having a 15-minute adverse impact so some protections are needed." Dominion also suggested revising the guidance to state, "Low Impact BES Cyber System Electronic Access Point (LEAP) – a Cyber Asset interface that allows Low Impact External Routable Connectivity." The SDT revised the sentences but retained the concepts.

NIPSCO, EEI, Oncor, Iberdrola USA, AEP, and Pepco Holdings recommended removing the sentence that states, "Individually, these low impact BES Cyber Systems pose a relatively lower risk to the BES than other BES Cyber Systems, but in aggregate or through communication dependencies, they have the potential to create an adverse reliability impact if compromised" because aggregating low impact BES Cyber Systems across multiple sites does not reflect a true risk-based assessment and therefore this sentence is not accurate. The SDT removed the sentence form the Rationale for Requirement R2.

NIPSCO, EEI, Oncor, Iberdrola USA, and Pepco Holdings commented that the bold subtitles in the Guidelines are inconsistent with section language in Attachment 1 and recommended changing the titles for Cyber Security Awareness and Physical Security Controls. The SDT revised the titles accordingly.

Exelon suggested that the SDT consider using "require" or "obligate" rather than "imply" in the guidance on Requirement R1, Attachment 1 – Physical Security and suggested making LEAP plural in the same section. The SDT revised the language to say "require." The SDT thanks the commenter for the suggestion to make LEAP plural but ultimately removed the language.

Southern Companies commented that the scenario for LERC and LEAP in the Attachment 2 Guidelines is unclear as to which firewall is the LEAP and suggested adding a scenario where there is LERC and an entity has flexibility to determine the LEAP. The SDT added additional scenarios to the Guidelines to clarify LERC and LEAP.

Southern Companies also suggested that the SDT rephrase the Guidelines to state, "However, the LERC between assets 'behind' the LEAP must pass through the single LEAP." The SDT revised the language accordingly.

Southern Companies, SMUD, BPA, IMPA, and APPA commented that the SDT should revise the Guidelines regarding EACMS and LEAPs and suggested that the SDT create a paragraph stating, "However, a LEAP can be implemented within the same Cyber Asset that is serving the function of EACMS or EAP for a medium or high impact BES Cyber System. This is possible because a LEAP is the interface on the controlling Cyber Asset (e.g. firewall or router) and not the Cyber Asset itself." The SDT addressed EACMS in the context of LEAPs in the Guidelines.

SPP-RE commented that the Guidelines for Requirement R2 states that monitoring does not imply logging and questioned how a Responsible Entity can demonstrate effective monitoring without recording unauthorized access or attempts at access. In response, the SDT notes that monitoring includes human observation or alerting mechanisms, and the retention of access logs is not required to implement monitoring controls.

Luminant Generation Company suggested several revisions to the Guidelines. For the Guidelines on Requirement R2, Attachment 1, Luminant commented that a discussion on LERC was not clear and recommended revisions to state, "SDT intends IED to IED communications be exempt from any requirement to use an LEAP even if there is LERC. Through this exemption, the SDT intends to not preclude the use of time-sensitive reliability enhancing data exchanges." In response, the SDT revised the LERC definition for clarity. Luminant suggested that the SDT revise the sentence regarding LEAPs and EACMS to read, "A LEAP is not to be considered an EACMS. In response, the SDT developed additional guidance regarding LEAPs and EACMS. Luminant suggested that the SDT replace "interface" with "internal interface" in the Guidelines describing LEAP. The SDT appreciates the comment but retains the language to better convey the practical use of interface in the definition. Luminant also suggested revising the Guidelines on LEAP to state, "…must also pass through a LEAP" instead of "must also pass through the single LEAP." Furthermore, Luminant suggested deleting "physically" from "unidirectional gateway that physically enforces outbound-only data flows." For the sentence beginning "The electronic access controls," Luminant suggested that the SDT replace shall with should. Finally, Luminant suggested that the SDT delete the sentence regarding assets without LERC and real-time monitoring. The SDT revised the language according to these suggestions but removed "unidirectional gateway."

Hydro-Quebec commented that the compliance date for electronic access controls is after the date for physical security controls in the Implementation Plan. The SDT has modified the Implementation Plan to make the compliance date for electronic access and physical security controls consistent.

MidAmerican and PacifiCorp recommended that the SDT continue working with the drafting team regarding dispersed generation applicability to determine what, if any, requirements apply to dispersed generation. The CIP SDT will continue to collaborate with the DGR SDT to address concerns with CIP and DGR.

Exelon, NYPA, Seattle City Light, MidAmerican, SMUD, BPA, IMPA, and APPA expressed concern that in a multi-impact rated program any failure to fulfill a requirement such as those in Sections 1 and 4 in Attachment 1 could result in violation of CIP-004 and CIP-008 as well. The SDT collaborated with NERC Enforcement in response. Responsible Entities may choose to implement multi-impact rated programs to address low, medium, and high impact BES Cyber Systems. It is possible the same facts and circumstances may indicate noncompliance of both the requirements applicable to low impact BES Cyber Systems and the corresponding requirements applicable to high and medium impact BES Cyber Systems. That the same act or omission may result in two separate violations is not unique to the CIP V5 standards. For example, the same failure to act immediately could constitute a violation of both TOP-001-1a R2 and TOP-008-1 R1. NERC's *Sanction Guidelines* provide that one penalty may be assessed where there are multiple violations arising from a single act or common incidence of noncompliance. Therefore, if a penalty is assessed at all, it would not be duplicated. In addition, the disposition of any noncompliance is based on the level of risk posed to the reliability of the BPS. Therefore, in the event one or more of the instances of noncompliance poses a minimal risk, a number of streamlined options is available, including treatment as a compliance exception. As with any noncompliance, a determination of whether compliance exception treatment will be appropriate in a given case will depend on the facts and circumstances.

Question 2: Low Impact Definitions

2. *The SDT proposed new definitions Low Impact External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) to clarify the requirement language in CIP-003-6. Do you agree with the proposed new definitions? If not, please offer suggested revisions.*

LERC in DMZ

TVA, EEI, NIPSCO, Oncor, Iberdrola USA, and FirstEnergy requested clarity regarding the scenarios in the Guidelines, specifically where the LEAP is located in the diagram and when LERC exists. TVA commented that it is unclear whether LERC exists in a scenario where all external communication is through a jump host or historian in a demilitarized zone (DMZ). The SDT added additional diagrams to the Guidelines and modified the definition to provide more clarity regarding LERC. The new definition states LERC is "*direct user-initiated interactive access or a direct device-to-device connection to a low impact BES Cyber System(s)….*"

In the Guidelines, it clearly demonstrates that if all communication from the low impact BES Cyber Systems is internal (e.g. the DMZ is implemented in such a way to restrict all external communication to the BES Cyber System), then LERC does not exist. In this case, the objective of protecting the low impact BES Cyber System is achieved.

Be aware, however, that if the low impact BES Cyber System has established bi-directional routable communication to an external Cyber Asset, then LERC does exist. This would be the case even if the low impact BES Cyber System communicates through a jump host DMZ using the same protocol session with an external Cyber Asset.

LEAP "Allows"

TVA, EEI, NIPSCO, NV Energy, Oncor, Southern Companies, Iberdrola USA, FirstEnergy, MRO NERC Standards Review Forum, and SMUD commented that the term "allows" in the definition is too broad and suggested that the SDT consider "controls" or "restricts." Duke Energy suggested using "permits." NPCC and NYPA commented that the guidance states "allows and controls" whereas the definition states "allows." The SDT agrees there is an inconsistency and changed "allows" to "controls" in both the definition and the guidance.

61850 Exclusion

Several stakeholders commented on the exclusion included in the LERC definition. Dominion, EEI, NIPSCO, NV Energy, Oncor, Southern Co, Iberdrola USA, and FirstEnergy requested clarification in the guidance that LERC excludes "point to point communications (e.g., between Intelligent Electronic Devices over fiber) that use routable communication protocols for time-sensitive protection or control functions." PacifiCorp and MidAmerican commented that the exclusion used undefined terms that cause confusion and refer to specific technologies which may become obsolete over time. In addition, PacifiCorp and MidAmerican commented that the exception seems to remove protections indiscriminately rather than addressing the assets to be protected. MidAmerican further commented that the use of capital letters for Intelligent Electronic Device creates confusion because it is not a defined NERC Glossary term and requested that the SDT explain why there is no exclusion for medium or high impact assets. NPPD commented that LERC should specifically exclude communications aiding in relaying used for pilot relaying protection and that the definition should be written to avoid technical terms. Pepco Holdings requested additional guidance on the exclusion.

The SDT revised the exclusion according to the suggestion to use "point to point communications…." The SDT coordinated with protection engineers to ensure the language was clear as to the exclusion. The SDT also put intelligent electronic device into lower case letters. The SDT considered removing the technologies in the

parentheses but determined that the examples provided clarity for some stakeholders. The SDT reviewed the language to limit technical terms as necessary and ultimately determined that the revisions made to the definition provide as much detail as necessary to reflect the SDT's intent. The SDT considered guidance related to the definition but determined that guidance would not be helpful because the terms would be moved to the NERC Glossary where there is no associated guidance. Therefore, the SDT focused on including detail in the definition rather than explanations in the guidance. Regarding the lack of exclusion for medium and high impact, the SDT considered this exclusion appropriate for low impact BES Cyber Systems because of the lower level of risk and large scale of applicability. The SDT explains the rationale for the exclusion in guidance stating the intent not to require a LEAP even though there is LERC or to preclude the use of such time-sensitive reliability enhancing functions if they use a bi-directional routable protocol.

Acronyms

EEI, NIPSCO, Oncor, Iberdrola USA, and FirstEnergy suggested that the SDT use the LEAP and LERC acronyms throughout the standard. The SDT agrees and added the acronyms in the definition and throughout the standard.

LEAP and EACMS

Several stakeholders commented on the relationship between LEAP and Electronic Access Control or Monitoring System (EACMS). EEI, NIPSCO, Duke Energy, Iberdrola USA, FirstEnergy, and FMPA commented that the definition and guidance for LEAP does not clearly explain that the Network Interface Card (NIC) (a port) is the LEAP rather than the device containing the NIC and that it is possible to have a NIC port inside a high or medium impact BES Cyber System Electronic Security Perimeter (ESP) in an EACMS. The commenters recommended additional guidance on the relationship between the LEAP and EACMS. TRE recommended removing the last sentence of the LEAP definition regarding EACMS.

The SDT removed the sentence "The Low Impact BES Cyber System Electronic Access Point is not an Electronic Access Control or Monitoring System." The SDT also revised the guidance to address the relationship between LEAP and EACMS.

BPA commented that using the term "access point" in LEAP creates confusion with medium and high impact EAP. The SDT thanks you for your comment. The SDT determined that the similar concepts from the medium and high impact EAP assisted entities in understanding expectations. However, the SDT revised the definition in response to comments to improve clarity.

Other

Entergy Services commented that it disagrees with the application of acronyms to only low impact. The SDT discussed the trade-offs of developing and applying a definition to only one standard. While not ideal to create definitions used in one standard, it resolved many clarity concerns the SDT had with the requirement language. The SDT decided that clarifying the terms used in the requirement language was beneficial.

MMWEC commented that "low impact BES Cyber System" should be "BES Cyber Systems associated with Low Impact assets" and that the SDT should consider changing "communication protocols created" to "communication using protocols created." The SDT thanks you for your comments. In the CIP-002-5 categorization, entities categorize the assets containing low impact BES Cyber Systems. The term low impact assets is not used. The phrase "communication protocols created…" has been replaced.

IESO commented that the definition for LERC states that "Bi-directional routable communications between low impact BES Cyber System(s) and Cyber Assets outside the asset containing those low impact BES Cyber System(s)" and suggested that the statement should include both BES Cyber Systems and BES Cyber Assets as LERC should apply to both systems and assets. The SDT thanks you for the comment. Per the definition, a BES Cyber System is

one or more BES Cyber Assets and every BES Cyber Asset must be in one or more BES Cyber System(s); therefore it is a superset and includes both.

AEP commented that the definitions create confusion where they refer to "asset" when it appears the term should be "facility" and suggested changing the second lowercase use of the word "asset" in each definition to be "facility." The SDT thanks you for your comment. The SDT previously considered the term “facility” but this term in lower case creates other challenges. The SDT selected “assets” to be consistent with CIP-002, which cites “assets” containing low impact BES Cyber Systems.

MidAmerican asked whether the Background in the Applicability section of CIP-003 should include the following phrase in the Background section of other CIP standards: “This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.” The SDT thanks you for your comment. The Background for CIP-003 is different from that within CIP-004 though -007 because low impact BES Cyber Systems are distinguished from high and medium impact BES Cyber Systems. This is not relevant for CIP-003-7 because the external routable connectivity is not used in reference to applicability.

Xcel Energy requested clarification on whether the logical network protected by the LEAP extends beyond a physical boundary and on whether the LERC definition is referring to access to or from a system or network. The SDT confirms the logical network protected by the LEAP may extend beyond a physical boundary. The SDT also confirms that designation of a LEAP does not imply additional obligations such as those for EACMS associated with medium or high impact BES Cyber Systems. All obligations for low impact BES Cyber Systems are found in CIP-003-7, Requirement R2.

Kansas City Power and Light (KCPL) and SPP and specific members commented that the new definitions are not clear. They commented that entities should describe their connectivity to their assets and how that’s managed. The SDT attempted many iterations of requirement language before defining the new terms. Use of the terms within the requirement language streamlined the requirement language and made it much clearer to understand the requirement obligations. Clearer requirement language reduces the risk of contradictory interpretations.

Encari requested clarification on the LERC definition and external connectivity and suggested “outside the network” instead of “outside the asset.” The SDT thanks you for your comment. The phrase “outside the asset” is intentionally used to keep the level of control at the asset/location level, but to accommodate the scenario in which a LEAP is located outside of the asset containing low impact BES Cyber Systems. The definition is not making a demarcation at the system level.

SPP-RE commented that it does not agree with the definition of LEAP because a LEAP may be placed external to the asset. Specifically, SPP-RE commented that protected assets could be exposed to the risk of unauthorized access if the communication circuits are over public Wide Area Networks using third-party service providers. In response, the SDT notes that a LEAP may be placed external to the asset, but all LERC must still be protected by a LEAP. The allowance of having an external LEAP does not provide the opportunity of having a Cyber Asset with unrestricted access to the low impact BES Cyber System. In addition, a LEAP must have physical security controls according to Section 2.

SPP-RE agreed with the definition of LERC. The SDT thanks you for your support.

Question 3: Transient Devices

3. *For the requirements applicable to transient devices, the SDT changed the structure of CIP-010-2, Requirement R4 and revised the language in response to stakeholder comments. Do you agree with the proposed requirements including CIP-010-2 Attachment 1? If not, please explain your objections and offer suggested revisions.*

Transient Cyber Assets Managed by the Responsible Entity

KCPL, SPP and specific members, and NPPD commented that Attachment 1, Section 1.2 contains requirements covered in other standards and should be removed. The SDT appreciates the comments received. However, the authorization in Element 1.2 is needed to identify who is specifically allowed to use these devices. The SDT agrees that these users may be a subset of the CIP-004-6 authorized users but contends that not all users will be listed in a program, (e.g., medium impact BES Cyber Systems without External Routable Connectivity does not require CIP-004-6 authorizations). Furthermore, CIP-004-6 requires authorization of the individual, whereas CIP-010 section 1.2 allows flexibility to document by individual or group. In response to your comment, the SDT revised the guidance for improved consistency.

AEP commented that section 1.2 regarding authorization of users is not practical when Transient Cyber Assets do not have External Routable Connectivity. The SDT appreciates the comment. However, the SDT considers authorization of users, regardless of External Routable Connectivity, to be necessary to address the risks posed by Transient Cyber Assets.

Luminant commented that section 1.3 "live operating system and software executable only from read-only media" is not clear. The SDT appreciates the comment. However, the SDT considers the current language to be in alignment with the intent of the requirement and technology available. Further, the SDT has concerns with Luminant's recommendation related to "other required executables". "Required" could introduce additional documentation elements that would be difficult to sustain. Additionally, Luminant suggested that the SDT should revise the section title for sections 1.4 and 1.5 to include "prevention" and recommended changing the requirement to include prevention and mitigation "if necessary." The SDT appreciates the comment. However, the SDT considers the title to be appropriate in defining the expectations and in line with the structure of the other elements. The SDT avoided using the term "prevent" to emphasize mitigation efforts over potential compliance concerns with a 100% performance standard that could be associated with "prevent". With regards to the addition of "if necessary" making the addition would further confuse the required actions.

SPP-RE commented that Section 1.4 should include a requirement to ensure any Removable Media is externally scanned for malware before use with a transient device. The SDT appreciates the comment. Scanning of Removable Media on the Transient Cyber Asset is not prohibited. The malicious code mitigation methods used by the Transient Cyber Asset could suffice in meeting this objective. Additionally, the SDT revised 3.2 to clarify that methods to detect malicious code on Removable Media are to be used on a Cyber Asset other than a BES Cyber System or Protected Cyber Asset.

Southern Companies suggested revising section 1.5 to state "The Transient Cyber Asset must reside within a location with restricted physical access." The SDT appreciates the comment. The SDT revised the language to read "Restrict physical access."

Transient Cyber Assets Managed by a Party Other than the Responsible Entity

Dominion and NPCC suggested revising sections 2.1 and 2.2 to state "at least one." The SDT appreciates the comments received. However, the language currently obligates an entity to use "at least one" through the requirement to "or a combination of" methods. The SDT made additional revisions to clarify the requirements.

Dominion commented that the "per Transient Cyber Asset capability" should be added to section 2.2. The SDT agrees with the comment and has revised the Requirement to address this concern.

SPP-RE commented that the review of a policy or process outlined in Sections 2.1 and 2.2 needs to include a step to confirm that the policy or process has been implemented for the transient devices. The SDT appreciates the comment. The entity is obligated to meet the objective of the requirement to mitigate the risk of software vulnerabilities and malicious code and demonstrate how this was accomplished for parties other than Responsible Entities. The SDT considers these appropriate controls for Transient Cyber Assets managed by a party other than the Responsible Entity in cases where complete verification may not be possible.

BC Hydro recommended that the SDT revise the requirements applicable to Responsible Entities regarding devices owned or managed by other entities because it would be infeasible to monitor other parties' devices. The SDT used the concept of a "plan" to allow the entity to define the controls and processes that are most appropriate to their organization. This includes determining how the entity will handle devices not under their management with the objective of meeting the performance requirements in Attachment 1, Section 2. Options are provided to enable the entity to be successful in protecting their systems from devices managed by parties other the Responsible Entity.

Exelon asked whether contract obligations could fulfill section 2. The SDT's response is yes, and further details are included in the Guidelines. To facilitate these controls, Responsible Entities may choose to execute agreements with other parties to provide support services to BES Cyber Systems and BES Cyber Assets that may involve the use of Transient Cyber Assets. Entities may consider using the Department Of Energy Cybersecurity Procurement Language for Energy Delivery dated April 2014. [2] Procurement language may unify the other party and entity actions supporting the BES Cyber Systems and BES Cyber Assets. CIP program attributes may be considered including roles and responsibilities, access controls, monitoring, logging, vulnerability, and patch management along with incident response and back up recovery may be part of the other party's support. Entities should consider the "General Cybersecurity Procurement Language" and "The Supplier's Life Cycle Security Program" when drafting Master Service Agreements, Contracts, and the CIP program processes and controls.

NPCC suggested adding authorization of vendor or contractor use of Transient Cyber Assets to section 1.2. The SDT appreciates the comment. The intent was not to require the entity to document vendor or contractor managed devices in the same manner as their own assets. However, entities should note that they need to demonstrate that the contractually obligated process was followed.

EEI, NIPSCO, Southern Companies, SMUD, MidAmerican, MISO, NPCC, and Iberdrola USA suggested adding "if necessary" to section 2.3 to clarify that entities can accept the device without requiring modifications. The SDT agrees with the comment, but opted to use "any" rather than "if necessary" for sentence structure.

CenterPoint recommended revising section 2.2 to read "...operating system software and other required executables *installed* from read-only media." The SDT appreciates the comment. However, the current language

[2] http://www.energy.gov/oe/downloads/cybersecurity-procurement-language-energy-delivery-april-2014

does not include the obligation to determine what is "required" to be installed on the device. It is simply to require all software, including the operating system be on read-only media.

AEP commented that section 2 should be removed because vendors and contractors are not subject to CIP requirements. The SDT appreciates the comments received and recognizes the lack of control for Transient Cyber Assets that are managed by parties other than the Responsible Entity. However, this does not obviate the Responsible Entity's responsibility to protect against the introduction of malicious code on their BES Cyber Systems. The SDT used the concept of a "plan" to allow the entity to define the controls and processes that are most appropriate to their organization. This includes determining how the entity will handle devices not under their management with the objective of meeting the performance requirements in Attachment 1, Section 2. Options are provided to enable the entity to be successful in protecting their systems from devices managed by parties other than the Responsible Entity.

Removable Media

EEI and CenterPoint commented that Section 3.2 does not require the entity to take any action other than scanning Removable Media. The SDT agrees with the comment and revised the CIP-010, Attachment 1, Section 3.2 to address this concern.

EEI, AEP, and CenterPoint commented that Section 3.2 should be revised because it presumes that scanning takes place on an external system when technology exists on USB drives, for example, to do scanning. The SDT appreciates the comments received. The SDT extensively discussed and revised Section 3.2 to clarify the obligations. The language seeks to address the risks of scanning for malicious code on the BES Cyber Asset and to prevent introduction of malicious code on the BES Cyber Asset. While the requirement does not address virus scanning on USB drives specifically, it does not preclude the use either since it is external to the BES Cyber Asset. Evidence could include documentation of the implementation of antivirus on the scanning system or procedural documentation of the actions taken. The methods used by the entity should be addressed in the plan document(s). The Guidelines and Technical Basis has been modified to address this matter.

Exelon asked how often entities should scan Removable Media to fulfill Section 3.2. The SDT revised the Guidelines to address this concern.

TVA commented that it is not necessary that a user of an authorized Removable Media device have electronic access to the applicable system because an individual with physical access to a system could be connecting removable media for someone with electronic access but working remotely. The SDT appreciates the comment. To clarify, the entity is required to include in their plan authorization of those using the Transient Cyber Asset or Removable Media to connect to a BES Cyber System. References to CIP-004 authorizations within the guidance have been updated.

BC Hydro commented that Section 3 should be revised to provide clarity regarding authorized users. The SDT extensively discussed Section 3 and revised the Guidelines and Technical Basis.

Measures & Guidance

EEI, NIPSCO, SMUD, Southern Companies, MISO, and MidAmerican requested that the Guidelines address authorization based on a group of assets. The SDT revised the Guidelines and Technical Basis to address this concern.

EEI and NIPSCO recommended that the SDT remove the restatement of requirement language from the Attachment 2 as it is not an example of evidence. The SDT thanks you for and agrees with the comment and revised Attachment 2 to address this concern.

NIPSCO, Southern Companies, and NV Energy commented that Section 3.2 of Attachment 2 should include examples of capabilities or embedded, real-time virus scanning and encryption on USB drives. The SDT appreciates the comment and revised Attachment 2 to address this concern.

Luminant recommended removing the last sentence of the measures for Sections 1.3, 1.4, 1.5, 2.1 and 2.2. The SDT thanks you for the comment; however, the team considers the last sentence to be support of "per Transient Cyber Asset capability" noted in the section.

TRE recommended adding the following language to M4: "including but not limited to a list of in-scope transient devices, and manual or automated logs showing connection periods...." The SDT thanks you for your comment. The use of these devices is limited to the context of change management and vulnerability assessment. The use of a plan to document how the entity implements the requirement should be the sole evaluation criteria for consideration in determining and proving compliance.

ACES Standards Collaborators requested the SDT develop additional guidance regarding what is not considered a transient device. The SDT thanks you for your comment but notes that prior comments requested that guidance on "what is not a transient device" be removed. It is not feasible to note all of the possibilities of what could be included in this list.

EEI, NIPSCO, Southern Companies, FMPA, IMPA, and AEP requested guidance that mitigation does not require that every vulnerability is addressed, as many may be unknown or not have an impact on the system. The SDT thanks you for and agrees with the comment and revised the Guidelines and Technical Basis to address this concern.

EEI, NIPSCO, Southern Companies, and CenterPoint requested clarification in the Guidelines and Technical Basis that the Responsible Entity has flexibility in determining how and when to manage vulnerability and malicious code reviews of their vendors or contractors and when additional mitigation actions are necessitated. Thank you for the comment. The SDT had previously addressed this concept in the Guidelines and Technical Basis. However, additional changes have been made to clarify further.

Luminant suggested the SDT revise the Guidelines and Technical Basis discussion of Section 1.5 to read, "Disk encryption will not protect a Transient Cyber Asset from unauthorized physical access" and "...Physical Security Perimeter or other physical location that manages physical access...." The SDT thanks you for the comment and has revised the Guidelines and Technical Basis to address this concern. Luminant also recommended deleting the statement "Entities should also consider whether malicious code is a Cyber Security Incident" in the Guidelines. The SDT thanks you for your comment but considers this to be important clarifying language to provide appropriate reminders to entities.

TVA suggested removing the following statement from the Guidelines: "Document the user(s), individually or by group/role, allowed to use the Removable Media. This can be done by listing a specific person, department, or job function. These user(s) must have authorized electronic access to the applicable system in accordance with CIP-004." The SDT appreciates the comment. References to CIP-004 authorizations within the guidance have been updated.

Miscellaneous

Duke Energy, KCPL, and SPP and specific members requested clarification on how often an entity needs to review the Transient Cyber Assets owned or managed by vendors or contractors. Thank you for the comment. The SDT used the concept of a "plan" to allow the entity to define the controls and processes that are most appropriate to

their organization. This includes the timing and frequency of performance of required sections from Attachment 1.

EEI, NIPSCO, and Southern California Edison Company commented that the placement of "CIP Exceptional Circumstances" is unclear in Requirement R4. The SDT agrees with the comment and revised the requirement to address this concern. Thank you for the comment.

EEI, NIPSCO, and Southern Companies commented that some Transient Cyber Assets could fall under both Sections 1 and 2 in certain circumstances and recommended removing "owned" from the requirements. The SDT thanks you for the comment and agrees with the comment. The SDT revised the requirements to address this concern by removing "Owned or" from Sections 1 and 2.

Hydro-Quebec Production commented that the impacts from these requirements are major for utilities. The SDT thanks you for the comment. However, requirement language is needed to address FERC Order No. 791 directives.

IESO and AEP suggested that transient devices requirements should be in the table format and transient devices should be added to the Applicable Systems column. The SDT appreciates the comment. The SDT received strong support for the plan and attachment format to allow entities flexibility in determining how to fulfill the security objectives based on the entity's specific facts and circumstances. Therefore, the SDT determined not to put the requirements into a table format.

MMWEC commented that the requirements should be limited to objectives and not specify controls, which should go in the measures. Thank you for your comment. The SDT discussed your recommendation extensively and chose to keep the bullets in Attachment 1. The SDT considers the options listed in Attachment 1 to be necessary and enforceable requirement obligations supporting Requirement R4.

TVA commented that Requirement R4 and its attachment do not clarify what is included in a plan. The SDT thanks you for your comment. The "Background" section of the Standard includes definitions of what constitutes a plan, program, or process. The terms program and plan are sometimes used in place of documented processes where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as plans (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter. Similarly, the term program may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms program and plan do not imply any additional requirements beyond what is stated in the standards.

TRE suggested the SDT apply the transient devices requirements to low impact. Thank you for your comment. Due to the wide-area impact of the high and medium impact assets, the SDT limited the requirements to those systems. This includes protection when connecting Transient Cyber Assets to multiple-impact rated systems.

EEI, NIPSCO, Southern Companies, Dominion, MRO NERC Standards Review Forum, NV Energy, MidAmerican, and PacifiCorp commented that the use of "Authorized" in 1.2.1, 1.2.2, 1.2.3, 3.1.1, and 3.1.2 is redundant and unnecessary in that the language of 1.2 and 1.3 requires a Responsible Entity to specify a user, location, and use for each Transient Cyber Asset (or group of) and specify a user and location for each Removable Media, which means an authorization for the Transient Cyber Asset. The plan should include authorization, which identifies the users, locations, and uses for each Transient Cyber Asset (or group of) and users and locations for each Removable Media, giving the Responsible Entity flexibility on how they write the plan to address these authorization

elements. Thank you for your comment. In response, the SDT agrees with the comment and revised Attachment 1 to address this concern by changing “specify” to “authorize.”

Southern California Edison suggested that Attachment 1 be revised to clarify the levels of review required based on the control exercised by a Responsible Entity over a Transient Cyber Asset. The language should be revised to describe the requirements when an entity has "full" or "substantial" control through its ownership and management of the asset, as compared when an entity has "minimal" control, as seen when leasing an asset from a vendor. Thank you for your comment. In response, the SDT used the concept of “parties other than the Responsible Entity” to allow the entity to define the controls and processes that are most appropriate to their organization.

AEP commented that the term “security vulnerabilities” is broader than security patch management or malicious code prevention used in CIP-007 and suggested the term be revised. The SDT thanks you for your comment. In response, the SDT revised the term to be “software vulnerabilities.”

Question 4: Transient Devices Definitions

4. *The SDT revised the proposed new definitions for Transient Cyber Assets and Removable Media to address issues raised in stakeholder comments. Do you agree with the proposed definitions? If not, please offer suggested revisions.*

General

CSU agrees with the changes that were made by the SDT to both Transient Cyber Assets and Removable Media definitions. Since "Media" is itself not a defined term, CSU recommends either defining "Media" or not capitalizing the term. In response, the SDT replaced "Media" at the beginning of the definition with "Storage media" in order to clarify the term and show it is not a defined NERC Glossary term.

Removable Media

IESO commented that the definition of Removable Media refers to media that are "capable of transmitting executable code to:" and suggested that the word "transmitting" is incorrect and should read "transferring". Media such as floppy disks do not transmit but one can transfer executable code from the disk to another media. In response, the SDT agrees and has modified the language.

Transient Cyber Assets

NPCC commented that based on the new definitions, it is unclear on whether a Cyber Asset can be classified as multiple asset types and would therefore be subject to multiple levels of requirements, i.e. a BES Cyber Asset or a Protected Cyber Asset can also be a Transient Cyber Asset. If a BES Cyber Asset or a PCA also meets the definition of Transient Cyber Asset, there is nothing in the language that says one classification supersedes or precludes another. Solely based on the definitions, it would appear that an entity would have to classify an asset by all the definitions that apply. NPCC recommended:

- Add the following sentence to definition of Transient Cyber Asset: "A Cyber Asset that meets the definition of BES Cyber Asset shall not be considered a Transient Cyber Asset."
- Add a minimum requirement to the PCA definition. "If a PCA is connected for less than 30 days then it is a TCA and more than 30 days it is a PCA."

In response, the intent of the SDT was for an asset to be classified under one definition and therefore subject to only one set of requirements. The SDT revised the definitions to clarify Removable Media is not a Cyber Asset and Transient Cyber Assets are not Protected Cyber Assets.

EEI, Pepco, and Iberdrola commented that for the Transient Cyber Asset definition, the "and" in the parenthesis after "A Cyber Asset," is confusing. It could be interpreted as meaning a Cyber Asset must use all of these types of communication connections. Also, the parenthetical for the examples is misplaced; it refers to examples of communication types not Cyber Assets. Also, the definition makes it unclear whether a Transient Cyber Asset could also be a BES Cyber Asset or a Protected Cyber Asset and, therefore, unclear as to which requirements apply. For example, if a Responsible Entity defines a BES Cyber System to include a device, which could also be considered a Transient Cyber Asset, does the BES Cyber System requirements apply, the Transient Cyber Asset requirements, or both? Finally, "directly connected" may be interpreted as meaning only non-routable communications; however, we believe the intent is to include both routable and non-routable communications. Therefore, EEI recommended changing the definition for Transient Cyber Asset to: "A Cyber Asset that is not included in a BES Cyber System and is not a Protected Cyber Asset (PCA) and is capable of transmitting executable code that is directly connected (e.g., using Ethernet, serial, Universal Serial Bus, or wireless including near field or Bluetooth) for 30 consecutive calendar days or less to (1) a BES Cyber Asset, (2) a network within an ESP, or (3) a Protected Cyber Asset. Examples include, but are not limited to, Cyber Assets used for data transfer, vulnerability assessment, maintenance, or troubleshooting purposes." Also, if the intent is for the Transient Cyber Asset

definition to apply to both routable and non-routable communications, EEI requested clarification in the Guidelines and Technical Basis for CIP-010-2. In response, the SDT has made several modifications to the definition of Transient Cyber Asset, as suggested, to address these issues. The SDT has not indicated the directly connection is routable or non-routable, but rather the examples in the definition list several types of direct connections, both routable and non-routable.

FirstEnergy, MMWEC, and Encari did not agree that the CIP Standards adequately specify the scope of devices that can be classified as Transient Cyber Assets. The definitions and standard language make it unclear whether a Transient Cyber Asset needs to be treated as a BES Cyber Asset or a Protected Cyber Asset and therefore which requirements apply. For example, if a Responsible Entity makes a temporary routable connection between a Transient Cyber Asset and an ESP, would this Transient Cyber Asset also have to meet the requirements for the BES Cyber System or for a connected PCA? In other words, could the BES Cyber System requirements also be construed to apply to a Transient Cyber Asset that is temporarily connected? In response, the SDT has modified the definition of Transient Cyber Asset to indicate it is neither a BES Cyber Asset nor a Protected Cyber Asset.

Tri-State G&T noted that the recent revisions made to the Removable Media and Transient Cyber Asset definitions introduced some unintended ambiguity. Revisions should be made to make it clear what the assets/devices must be connected to, in order to clarify this qualifier of the definition. It is our understanding that the intent of the drafting team was to state "...directly connected... [clause]... to..." where the items after the "to" is what the "Cyber Asset" or "Media" is connected to. One simple solution is to add a comma after the [clause] and before the word "to". Another option is to state the [clause] part after the list of what the "Cyber Asset" or "Media" is connected to. In response, the SDT has made revisions to the definition to address this potential ambiguity. The modifier comes before the indicated preposition.

SMUD, FMPA, and BPA agreed with the changes that were made by the SDT to both Transient Cyber Assets and Removable Media definitions. However, SMUD is concerned with starting the definition of Removable Media with the capitalized "Media" considering that "Media" is itself not a defined term. In response, the SDT has modified the definition to address these comments.

AEP commented that regarding Transient Cyber Assets, the 30 day timeframe prevents a Responsible Entity from being able to consider a device that is temporarily connected to the BES Cyber System as part of the BES Cyber System, and it is arbitrarily beyond what was ordered by FERC. AEP suggests removing the 30 day timeframe to reduce the amount of tracking Responsible Entities must do with respect to these devices. In response, the entity may designate the device as a PCA and follow the applicable requirements for a PCA. The TCA definition was revised to clarify that a PCA would not be a TCA.

Question 5: Implementation Plan

5. *In response to stakeholder comments, the SDT revised the implementation deadlines. The implementation plan now includes tiered deadlines for the aspects of CIP-003-6. The CIP-007-6 timeframe is now consistent with CIP-006-6. Are these timeframes reasonable and appropriate? If not please explain specifically which implementation plan item needs adjusting and include the rationale for the suggested change.*

Complexity

AEP suggested streamlining the implementation date to the latest date proposed in the Version X and Version 6 implementation plans. KCP&L and SPP & specific members commented that there should be one date for high and medium impact BES Cyber Assets and their accompanying devices and one for low impact BES Cyber Systems. KCP&L and SPP and specific members further recommended that the latest date for each grouping be chosen as a new effective date for all requirements. In response, the SDT thanks you for your comment. With support of stakeholder input, the SDT decided that the added time given under the staggered implementation plan was important to the more labor intensive requirements. While the SDT was unable to move to a later deadline for all requirement areas, in CIP-003, the SDT revised deadline for both sections 2 and 3 to September 1, 2018.

Xcel stated it did not support the revised language providing for tiered deadlines for low impact assets. In response, the SDT thanks you for your comments but states that the majority of industry supports this approach.

Tri-State G&T comments that the timelines are fine, but written in a very convoluted way. It would be helpful to state them more succinctly. In response, NERC will consider creating an informational worksheet to more simply and succinctly see the implementation compliance deadlines.

Protecting LEAP's Before They're Identified

Consumers, EEI, Oncor, Southern Company, MidAmerican, NIPSCO, Duke, First Energy, NV Energy, NRECA, and Hydro Quebec commented on the different effective dates for Elements 2 and 3. Thank you for your comments. In response, the SDT revised the implementation plan to include a September 1, 2018 compliance deadline for CIP-003, Sections 2 and 3.

Excessive Time Period

Texas RE suggests that the proposed implementation time periods are excessive by 12 months, particularly for administrative documentation. Thank you for your comment. The majority of stakeholders supported the proposed deadlines.

Needing More Time

Idaho Power commented that the time frames still do not provide enough time for entities to adjust to an increase in scope of this magnitude. The SDT thanks you for your comment. While the SDT was unable to move to a later deadline for all requirement areas, in CIP-003, the SDT revised the compliance deadline for Section 2 Physical security controls to September 1, 2018.

BPA disagrees with the tiered implementation timeline as currently proposed. BPA believes more time is required to create practices and procedures to implement the policy effectively. BPA suggests that policy (CIP-003-6, R1, part 1.2) be implemented prior to other requirements (CIP-003-6, R2 and CIP-003-6, R2 Attachment 1, items 1-

4). The SDT thanks you for your comment. The SDT was unable to move to a later deadline for all requirement areas, in CIP-003, the SDT revised the compliance deadline for Section 2 Physical security to September 1, 2018.

ACES Standards Collaborators commented that the SDT should consider modifying the implementation dates for electronic access and physical security to be 18 months from the effective date of April 1, 2017. Physical security implementations, depending on the site(s), could have long durations and require additional budget cycles to implement across a diverse geographic and multiple asset types. The SDT thanks you for your comment. The SDT revised the compliance deadline for Section 2 Physical security controls to match the Section 3 Electronic access controls compliance deadline of September 1, 2018, which is 18 months after the April 1, 2017 effective date as ACES proposed.

Support for the Implementation Plan

ATC appreciated the SDT's consideration of previous comments, and supports the adjustments in the implementation plan that accommodate for the time necessary to be successful in implementing Sections 2 and 3 for Low Impact pursuant to CIP-003-6. The SDT thanks you for your support.

SMUD, CSU, Exelon, FMPA, MISO, Occidental Chemical Corporation, NYPA, TVA, NPCC, Dominion, MRO NERC Standards Review Forum, Iberdrola USA, PJM Interconnection LLC, PacifiCorp, Arizona Public Service Company, Encari, Luminant Generation Company, LLC, Rutherford EMC, ATCO Electric, CenterPoint Energy Houston Electric LLC, Manitoba Hydro, Independent Electricity System Operator, Entergy Services, Southern California Edison Company, Pepco Holdings, NRG Energy, and Massachusetts Municipal Wholesale Electric Company supported the implementation plan. The SDT thanks you for your support.

Question 6: Removal of the IAC Language

6. *The results of the initial CIP V5 Revisions ballot showed industry support for the new Communication Networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015. Meanwhile, the CIP-003-6 and CIP-010-2 revisions proposed to address the Low Impact and Transient Devices directives did not pass initial ballot.*

   In order to separate approval of the IAC and Communication Networks revisions from the Low Impact and Transient Device revisions where they occur within the same standard, the relevant standards are posted separately. This separate posting provides additional options to meet the FERC filing deadline of February 3, 2015 in the event Low Impact or Transient Device revisions do not obtain industry approval in the current ballot. (Please see explanatory document on the CIP Version 5 Revisions project page for more information)

   Do you support removal of the IAC language from the 17 Requirements across CIP Version 5 Standards? If not, please explain why.

The SDT's responses to comments on those revisions are available here.

Question 7: Other Areas Within SAR

7. *Do you have input not discussed in the questions above on other areas relative to the revisions made to the standards or implementation plan since the initial posting and within the scope of the Standards Authorization Request? If so, please provide them here, recognizing that you do not have to provide a response to all questions.*

Some comments from this question were addressed in the previous consideration of comments from the standard drafting team. Those responses only pertained to the revisions in the Version X posting and are available here.

In addition, the SDT addressed the majority of comments in response to this question in other questions in this consideration of comments.

Responses to those not previously addressed are as follows:

Striving for Steady-State

ACES commented on the importance of approving CIP 5 revisions without further changes (so that they are steady-state) to allow for the impacted entities to plan, budget and implement CIP Version 5. The SDT thanks you for your comments and shares the desire to reach a "steady-state" with the CIP standards. The SDT worked to address all four directive issue areas concurrently to respond to the FERC directives in a timely manner. The proposed revisions received passing ballots for all the issue areas in the second posting. However, the SDT felt it important to continue work in response to the constructive comments received and consider further improvements to the revisions. The SDT will post for an additional comment and ballot period and hopes to see additional support for the proposals based on the additional refinements.

NPPD commented that these standards must get to a steady state and changes to the standards should be limited to an absolute minimum. Thank you for your comment. The SDT shares the desire to reach a "steady-state" with the CIP standards. The SDT has worked diligently to address the FERC directives in a timely manner through the NERC iterative, stakeholder process.

Take the Time Needed

AEP urged the SDT to take the time necessary to ensure that the requirements achieve the necessary reliability benefit and that there is broad-based industry support. The SDT thanks you for your comment. The SDT shares AEPs desire to have broad-based industry support for the revisions in response to FERC Order 791. While the revisions for all four issue areas passed stakeholder ballot in the second posting, the SDT felt it important to continue work in response to the constructive comments received. The SDT hopes to see additional support for the proposals based on the additional refinements.

Define Cyber Security Plan

BC Hydro recommended that the term “cyber security plan” be defined or further explained in guidance. Thank you for your comment. The documents developed and implemented in response to CIP-003 R2 are to include the CIP-003 Attachment 1 sections and identify what will essentially become the entity's cyber security plan. The SDT deliberately avoided creating a "Cyber Security Plan" definition, in order to provide entities the flexibility to include these Sections within a more inclusive set of documents, if so desired. For instance, an entity may have an overarching security plan that includes overall physical security, as well as physical security and cyber security for high impact BES Cyber Systems, medium impact BES Cyber Systems, and low impact BES Cyber Systems.

Overly Prescriptive

AEP commented that it was concerned about prescriptive approaches within the standards and the potential to unreasonably restrict the Responsible Entities from defining their own programs. The SDT appreciates the comment. CIP-003-6 Requirement R2 and Attachment 1 have been further revised to strike a balance in FERC's Order 791 determination for greater specificity, providing industry clear options for achieving compliance, as well as flexibility in achieving the Requirement R2 objectives, stated within each Attachment 1 Section. CIP-010-2 R4 and its corresponding Attachment 1 Sections have been further revised as well, seeking the same balance. Many within this SDT and industry believe the current level of specificity, while some may see it as prescriptive, also serves to provide greater predictability and limitations on how various regional auditors might interpret language within those stated objectives.

RSAWs

FMPA commented that their negative votes were due to the current condition of the RSAWs and the status of RAI implementation, in particular on how RAI will address zero tolerance. This SDT submitted comments on the draft RSAWs posted for comment. The SDT continues to be available to work with NERC on RSAWs. In addition, the SDT has forwarded and continues to share the comments on RAI/compliance and enforcement with the relevant NERC divisions. Thank you for your comment.

SMUD also commented that the RSAWs have not sufficiently incorporated the specific language of the standards or the measures. It is unclear from reading the currently posted RSAWs how auditors will use the measures to inform the Compliance Assessment Approach. The SDT submitted comments on the proposed RSAWs during the comment period and continues to be available to work with NERC on RSAWs.

Quality Review

NPC and NYPA recommended quality assurance review before future postings, to avoid reviewers' confusion or need to decipher how to connect related information. Thank you for your comment. The SDT and other resources are in place to conduct a quality review prior to the next posting.

Scope of Nonprogrammable Components

BPA disagreed with the CIP-007-6 R1.2 expansion of scope to non-programmable communication components and proposes re-alignment to R1.1. Thank you for your comment. The SDT confirms that this expands the scope of 1.2, but it does so appropriately and in response to the Order 791 directive to address the security of nonprogrammable components associated with BES Cyber Systems. CIP-007-6 Requirement Part 1.2 concerns the physical security of computing equipment ports. Nonprogrammable components did not previously meet the definition and applicability for Cyber Assets but they may have the same vulnerability that this Requirement Part addresses. The expanded scope closes this gap in protection.

Device Types

MRO suggested that the SDT insert "type" in reference to devices into CIP-010-2 Guidelines and Technical Basis Section 1.1. The SDT thanks you for your comment. While "device types" is one method of grouping TCA devices that entities will likely apply per Attachment 1 Section 1.1, the SDT is reluctant to include this citation within guidance and thereby risk limiting the scope of entity's options for grouping.

Consideration of Comments: Project 2014-02 CIP Version 5 Revisions

The Project 2014-02 Drafting Team thanks all commenters who submitted comments on the Critical Infrastructure Protection Version 5 standards. The standards were posted for a 45-day public comment period from September 3, 2014 through October 17, 2014. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 70 responses, including comments from approximately 164 different people from approximately 117 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

This consideration of comments is responding to the comments received on the standards and implementation plan balloted as Version X, which was posted for a 45-day comment period and ballot. There was a concurrent 45-day comment period and ballot for CIP-003-6 and CIP-010-2, which included revisions to address the low impact and transient device directives. The response to the comments received regarding those revisions will be posted when the revisions are posted for an additional comment period and ballot.

All comments submitted may be reviewed in their original format on the standards' project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at valerie.agnew@nerc.net . In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf

Introduction

The SDT appreciates industry comments on the revisions to the CIP Reliability Standards. During the development of the revised standards prior to posting, the SDT made it a priority to conduct outreach as modifications were made to the standards. The SDT conducted one face-to-face meeting to revise the standards, Implementation Plan, Violation Risk Factors (VRFs), and Violation Severity Levels (VSLs) in order to appropriately consider all comments received. The SDT continues its rigorous conference call schedule as it understands the importance of getting these standards to steady state.

Background

On November 22, 2013, FERC issued Order No. 791, Version 5 Critical Infrastructure Protection Reliability Standards. In this order, FERC approved version 5 of the CIP standards and also directed that NERC make the following modifications to those standards:

1. Modify or remove the "identify, assess, and correct" (IAC) language in 17 CIP version 5 requirements.
2. Develop modifications to the CIP standards to address security controls for to assets containing low impact BES Cyber Systems.
3. Develop requirements that protect transient electronic devices.
4. Create a definition of "communication networks" and develop new or modified standards that address the protection of communication networks.

FERC directed NERC to submit new or modified standards responding to the directives related to the IAC language and communication networks by February 3, 2015, one year from the effective date of Order No. 791. FERC did not place any time frame for NERC to respond to the low impact and transient electronic devices directives. The purpose of the proposed project is to address the directives from FERC Order No. 791 to develop or modify the CIP standards.

Question 6: Version X

6. *The results of the initial CIP V5 Revisions ballot showed industry support for the new Communication Networks requirements and the removal of the Identify, Assess, and Correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015. Meanwhile, the CIP-003-6 and CIP-010-2 revisions proposed to address the Low Impact and Transient Devices directives did not pass initial ballot.*

   In order to separate approval of the IAC and Communication Networks revisions from the Low Impact and Transient Device revisions where they occur within the same standard, the relevant standards are posted separately. This separate posting provides additional options to meet the FERC filing deadline of February 3, 2015 in the event Low Impact or Transient Device revisions do not obtain industry approval in the current ballot. (Please see explanatory document on the CIP Version 5 Revisions project page for more information)

   Do you support removal of the IAC language from the 17 Requirements across CIP Version 5 Standards? If not, please explain why.

Many commenters expressed support for the removal of the IAC language through a 'yes' response to Question 6 without any additional comments. Those commenters include American Transmission Company LLC, FirstEnergy, Tennessee Valley Authority, Northeast Power Coordinating Council, Dominion, MRO NERC Standards Review Forum, Duke Energy, Iberdrola USA, PJM Interconnection LLC, Edison Electric Institute, Oncor, Arizona Public Service Company, Encari, Luminant Generation Company, LLC, ATCO Electric, Idaho Power, Manitoba Hydro, Independent Electricity System Operator, Texas Reliability Entity, Entergy Services, Inc., Southern California Edison Company, Pepco Holdings Inc., Hydro-Quebec Production, Kansas City Power & Light, Consumers Energy Company, NV Energy, Massachusetts Municipal Wholesale Electric Company, and Tri-State Generation and Transmission Association, Inc.

Support IAC Removal but Comments on Zero Tolerance and Lows

Florida Municipal Power Agency (FMPA), BC Hydro, Indiana Municipal Power Agency (IMPA), and ACES Standards collaborators supported the removal of the IAC language but expressed concern over zero tolerance requirements. While the removal of the IAC language returns the requirements to a zero tolerance construct, NERC is implementing risk-based compliance monitoring and enforcement processes to address the zero tolerance concerns. The SDT will forward concerns raised with compliance and enforcement to the relevant NERC departments. In response to IMPA, NERC is making an informational filing with FERC regarding the risk-based Compliance Monitoring and Enforcement Program on or about October 31, 2014. In response to ACES Standards collaborators, the risk-based compliance monitoring and enforcement processes will all be implemented by January 1, 2015.

Calpine agrees with removing IAC from the standards for high and medium impact categories but recommended keeping IAC for the low impact category. In response, Calpine did not further explain its rationale for its recommendation, but the SDT determined that using the IAC language for different classification levels would not appropriately address the FERC directive.

FMPA requested additional clarity in the Reliability Standard Audit Worksheets (RSAWs) as the currently posted RSAWs do not provide enough clarity and guidance on compliance expectations to understand if zero tolerance concerns have been addressed. NERC is reviewing the comments made to the RSAWs. In response, while the removal of the IAC language returns the requirements to a zero tolerance construct, NERC is implementing risk-based compliance monitoring and enforcement processes to address the zero tolerance concerns. The SDT will forward concerns raised with compliance and enforcement to the relevant NERC departments.

Expectations for RAI and its Fulfillment of the IAC Intent

SPP and specific members commented that the RAI program is not complete and has not been used in the audit and enforcement process, and it requires a significant amount of trust. In response, while the removal of the IAC language returns the requirements to a zero tolerance construct, NERC is implementing risk-based compliance monitoring and enforcement processes to address the zero tolerance concerns. Risk-based compliance monitoring and enforcement processes are already in use.

CenterPoint Energy Houston Electric LLC supported this revision approach for IAC. As proposed by NERC, the Company looks forward to the concepts of IAC being implemented within the final framework of the RAI. MISO, Occidental Chemical Corporation, Sacramento Municipal Utility District (SMUD), MidAmerican Energy Company, American Electric Power, and Xcel Energy supported the removal of IAC in the timeframe ordered by FERC and supported the continued work by NERC to develop RAI. In contrast, Rutherford EMC commented that the IAC language provided a more proactive results-based approach to truly identify, assess, and correct problems rather than follow standards. In response to all commenters, for additional information regarding how the concepts of IAC will be implemented within the risk-based compliance monitoring and enforcement framework, please see *The Application of Risk-based Compliance Monitoring and Enforcement Program Concepts to CIP Version 5*[2], available on NERC's RAI web page.

Does Not Support Removal

Nebraska Public Power District (NPPD) and City of Austin d/b/a Austin Energy commented that they do not support the removal of the IAC language. NPPD and Austin Energy went on to suggest that either the requirements containing IAC be removed entirely or to keep the IAC language as is in Version 5. As stated in the prior consideration of comments, the SDT states that FERC approved the security control requirements within Version 5, but found the IAC language related to compliance to the requirements and objected to its inclusion in the requirement itself. The SDT will forward concerns raised with compliance and enforcement to the relevant NERC departments.

Completing Revisions to all Four Directive Areas

Exelon Companies commented that it strongly supports the SDT's efforts to complete revisions in all four directive areas by the February 3, 2015 filing deadline. Similarly, National Rural Electric Cooperative Association (NRECA) supported the Version X package and is hopeful the SDT can successfully complete revisions to CIP Version 5 for the four directive areas by the February 3, 2015 filing deadline. NRECA went on to state that by having the four directive areas addressed by the filing deadline will be critical to achieve a steady-state of NERC CIP standards. In response, the SDT continues its work with the intent of completing revisions responding to all four FERC directive areas.

Question 7: Other Areas Within SAR

7. *Do you have input not discussed in the questions above on other areas relative to the revisions made to the standards or implementation plan since the initial posting and within the scope of the Standards Authorization Request? If so, please provide them here, recognizing that you do not have to provide a response to all questions.*

Some comments from this question will be addressed in a future consideration of comments from the standard drafting team. The responses below only pertain to the revisions in the Version X posting.

Communication Networks

Bonneville Power Administration (BPA) commented that CIP-007-6, Requirement R1, Part 1.2 expands the scope of the requirement to nonprogrammable communication components and suggested that Part 1.2 be revised to align with Part 1.1. In addition, BPA requested additional guidance on the specific nonprogrammable communication components located inside both a Physical Security Perimeter (PSP) and an Electronic Security Perimeter (ESP). The SDT confirms this expands the scope of Part 1.2, but it does so appropriately and in response to the Order No. 791 directive to address the security of nonprogrammable components associated with BES Cyber Systems. CIP-007-6, Requirement R1, Part 1.2 concerns the physical security of computing equipment ports. Nonprogrammable components did not previously meet the definition and applicability for Cyber Assets but they may have the same vulnerability this Requirement Part addresses. The expanded scope closes this gap in protection. In response to the request for additional guidance, the SDT added a diagram to the Guidelines and Technical Basis section of CIP-007-6 to further illustrate the intent behind including components inside both a PSP and an ESP.

FMPA and EEI requested clarification on whether an entity can violate CIP-007-6, Requirement R2, Part 2.3 while still meeting Part 2.4. The SDT appreciates the comment but notes that the SDT did not focus on this requirement during its revisions. However, the SDT notes that CIP-007-5, R2, Requirement 2, Part 2.4 allows an entity to modify an existing mitigation plan that is created in Part 2.3. The Requirement Part language allows for "an extension to the timeframe specified in Part 2.3" and have the extension "approved by the CIP Senior Manager or delegate."

Version X

NRG Energy suggested removing the word “shall” from all the sections in the attachment. The SDT appreciates the comment but notes that the attachments were not included as part of the Version X package. The SDT will respond to this comment along with other comments related to the low impact and transient devices revisions.

General

City of Austin d/b/a Austin Energy commented that the CIP Version 5 standards have been difficult to implement, and it would like the standards to get to steady-state with minimal revisions. The SDT appreciates the comment and notes that its focus was on the four directive areas for these revisions. Furthermore, the SDT continues its work with the intent of completing revisions to get to steady-state.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

See Implementation Plan for CIP-003-6.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save

the BES. A review of UFLS tolerances defined within Regional Reliability Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements of the standard.

Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements of the standard.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

R2. Each Responsible Entity for its assets identified in CIP-002-5.1, Requirement R1, Part R1.3, shall implement one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP Senior Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the

specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address one of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 15 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address two of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 16 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address three of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 17 calendar months but did complete this review in less than or equal to 18	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address four or more of the nine topics required by R1. (R1) OR The Responsible Entity did not have any documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1. (R1) OR

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-6, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate for its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-6, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-6, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems is not

necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity significant flexibility to adapt this requirement to its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up-to-date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

~~**Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.**~~

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. ~~3.~~ Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~an additional comment and ballot to ballot the removal of "identify, assess, and correct" language~~final ballot. The draft includes modifications to meet the FERC Order No. 791 directive~~s to remove or modify the "identify, assess, and correct" language from CIP-003~~.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~September 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-003-5.	
~~X~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~X~~6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~X~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

~~Reliability Standard CIP-003-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.~~

~~Registered Entities shall not be required to comply with Reliability Standard CIP-003-X, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-X~~See Implementation Plan for CIP-003-6.

6. Background:

Standard CIP-003 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards

could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System~~BES. A review of UFLS tolerances defined within ~~regional~~ Regional ~~reliability~~ Reliability ~~standards~~ Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

Rationale for Requirement R1:

One or more security policies enable effective implementation of the ~~standard's~~ requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the ~~standard's~~ requirements of the standard.

Annual review and approval of the cyber security policy ensures that the policy is kept~~-~~ up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);
- **1.7** Configuration change management and vulnerability assessments (CIP-010);
- **1.8** Information protection (CIP-011); and
- **1.9** Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R2:

One or more security policies enable effective implementation of the ~~standard's~~ requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the ~~standard's~~ requirements of the standard.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

R2. Each Responsible Entity for its assets identified in CIP-002-5.1, Requirement R1, Part R1.3, shall implement one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **2.1** Cyber security awareness;
- **2.2** Physical security controls;
- **2.3** Electronic access controls for external routable protocol connections and Dial-up Connectivity; and
- **2.4** Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP ~~senior~~ Senior ~~manager~~ Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These

delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-~~X~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address one of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 15 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address two of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 16 calendar months but did complete this review	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address three of the nine topics required by R1. (R1) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 within 17 calendar months but did complete this review in less than or equal to 18	The Responsible Entity documented and implemented one or more cyber security policies for its high impact and medium impact BES Cyber Systems, but did not address four or more of the nine topics required by R1. (R1) OR The Responsible Entity did not have any documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1. (R1) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-003-~~X~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			in less than or equal to 16 calendar months of the previous review. (R1) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for its high impact and medium impact BES Cyber Systems as required by R1 by the CIP Senior Manager or delegate within 15 calendar months but did complete this approval in less than or equal to 16 calendar months of the previous approval. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-~~X~~6, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~X~~6, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-~~X~~6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate ~~to~~ for its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-~~X~~6, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~X~~6, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems

is not necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-~~X~~6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that ~~this~~ the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-~~X~~6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity ~~should have~~ significant flexibility to adapt this requirement to ~~their~~ its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records ~~provides~~ shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations ~~up~~ up ~~to~~ to date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014
~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

~~Effective Dates~~

1. ~~**24 Months Minimum –** CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval. CIP-003-5, Requirement R2 shall become effective on the later of July 1, 2016, or the first calendar day of the 13th calendar quarter after the effective date of the order providing applicable regulatory approval.~~

2. ~~In those jurisdictions where no regulatory approval is required, CIP-003-5, except for CIP-003-5, Requirement R2, shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, and CIP-003-5, Requirement R2 shall become effective on the first day of the 13th calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated ~~version number~~Version Number from -2 to -3 ~~Approved by~~ In Requirement 1.6, deleted the ~~NERC Board of Trustees.~~ sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	~~Update to conform to changes to CIP-002-4 (Project 2008-06)~~
5	~~TBD~~11/26/12	Adopted by the NERC Board of Trustees.~~Modified to coordinate with other CIP standards and to revise format to use RBS Template.~~	Modified to coordinate with other CIP standards and to revise format to use RBS Template.

Version	Date	Action	Change Tracking
5	11/22/13	FERC Order issued approving CIP-003-5.	

~~Definitions of Terms Used in the Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-~~5~~6

3. Purpose: To specify consistent and sustainable security management controls that establish responsibility and accountability to protect Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-003-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

5. Effective Dates:

See Implementation Plan for CIP-003-6.

6. Background:

Standard CIP-003~~-5~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident

response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans, and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Reliability Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures provide examples of evidence to show documentation and implementation of the requirement. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the ~~Bulk Electric System.~~BES. A review of UFLS tolerances defined within ~~regional reliability standards~~Regional Reliability Standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

B. Requirements and Measures

~~**Rationale – R1:**~~

~~One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.~~

~~Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.~~

Rationale for Requirement R1:

One or more security policies enable effective implementation of the requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements of the standard.

Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.

R1. Each Responsible Entity, for its high impact and medium impact BES Cyber Systems, shall review and obtain CIP Senior Manager approval at least once every 15 calendar months for one or more documented cyber security policies that collectively address the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1** Personnel & training (CIP-004);
- **1.2** Electronic Security Perimeters (CIP-005) including Interactive Remote Access;
- **1.3** Physical security of BES Cyber Systems (CIP-006);
- **1.4** System security management (CIP-007);
- **1.5** Incident reporting and response planning (CIP-008);
- **1.6** Recovery plans for BES Cyber Systems (CIP-009);

1.7 Configuration change management and vulnerability assessments (CIP-010);

1.8 Information protection (CIP-011); and

1.9 Declaring and responding to CIP Exceptional Circumstances.

M1. Examples of evidence may include, but are not limited to, policy documents; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

~~**Rationale – R2:**~~

~~One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the standard's requirements.~~

~~The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.~~

~~Review and approval of the cyber security policy at least every 15 calendar months ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the protection of its BES Cyber Systems.~~

Rationale for Requirement R2:

One or more security policies enable effective implementation of the requirements of the standard. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to low impact BES Cyber Systems. The Responsible Entity can demonstrate through its policies that its management supports the accountability and responsibility necessary for effective implementation of the requirements of the standard.

The language in Requirement R2, Part 2.3 ". . . for external routable protocol connections and Dial-up Connectivity . . ." was included to acknowledge the support given in FERC Order No. 761, paragraph 87, for electronic security perimeter protections "of some form" to be applied to all BES Cyber Systems, regardless of impact. Part 2.3 uses the phrase "external routable protocol connections" instead of the defined term "External Routable Connectivity," because the latter term has very specific connotations relating to Electronic Security Perimeters and high and medium impact BES Cyber Systems. Using the glossary term "External Routable Connectivity" in the context of Requirement R2 would not be appropriate because Requirement R2 is limited in scope to low impact BES Cyber Systems.

R2. Each Responsible Entity for its assets identified in CIP-002-5.1, Requirement R1, Part R1.3, shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1 Cyber security awareness;

2.2 Physical security controls;

2.3 Electronic access controls for external routable protocol connections and Dial-up Connectivity; and

2.4 Incident response to a Cyber Security Incident.

An inventory, list, or discrete identification of low impact BES Cyber Systems or their BES Cyber Assets is not required.

M2. Examples of evidence may include, but are not limited to, one or more documented cyber security policies and evidence of processes, procedures, or plans that demonstrate the implementation of the required topics; revision history, records of review, or workflow evidence from a document management system that indicate review of each cyber security policy at least once every 15 calendar months; and documented approval by the CIP Senior Manager for each cyber security policy.

~~**Rationale – R3:**~~

~~The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.~~

~~FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.~~

Rationale for Requirement R3:

The identification and documentation of the single CIP Senior Manager ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43. The language that identifies CIP Senior Manager responsibilities is included in the *Glossary of Terms used in NERC Reliability Standards* so that it may be used across the body of CIP standards without an explicit cross-reference.

FERC Order No. 706, Paragraph 296, requests consideration of whether the single senior manager should be a corporate officer or equivalent. As implicated through the defined term, the senior manager has "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" which ensures that the senior manager is of sufficient position in the Responsible Entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business

models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the CIP Senior Manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent basis.

R3. Each Responsible Entity shall identify a CIP Senior Manager by name and document any change within 30 calendar days of the change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. An example of evidence may include, but is not limited to, a dated and approved document from a high level official designating the name of the individual identified as the CIP Senior Manager.

~~**Rationale – R4:**~~

~~The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.~~

~~In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.~~

Rationale for Requirement R4:

The intent of the requirement is to ensure clear accountability within an organization for certain security matters. It also ensures that delegations are kept up-to-date and that individuals do not assume undocumented authority.

In FERC Order No. 706, Paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations so that this line of authority is clear and apparent from the documented delegations.

R4. The Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ a documented process to delegate authority, unless no delegations are used. Where allowed by the CIP Standards, the CIP Senior Manager may delegate authority for specific actions to a delegate or delegates. These delegations shall be documented, including the name or title of the delegate, the specific actions delegated, and the date of the delegation; approved by the CIP Senior Manager; and updated within 30 days of any change to the delegation. Delegation changes do not need to be reinstated with a change to the delegator. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. An example of evidence may include, but is not limited to, a dated document, approved by the CIP Senior Manager, listing individuals (by name or title) who are delegated the authority to approve or authorize specifically identified items.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

The Regional Entity shall serve asAs defined in the NERC Rules of Procedure, "Compliance Enforcement Authority (" (CEA") unless) means NERC or the applicable entity is owned, operated, or controlled byRegional Entity in their respective roles of monitoring and enforcing compliance with the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEANERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The number of policies and their specific language are guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the nine topical areas required by CIP-003-~~5~~6, Requirement R1. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~5~~6, Requirement R1. Implementation of the cyber security policy is not specifically included in CIP-003-~~5~~6, Requirement R1 as it is envisioned that the implementation of this policy is evidenced through successful implementation of CIP-004 through CIP-011. However, Responsible Entities are encouraged not to limit the scope of their cyber security policies to only those requirements from CIP-004 through CIP-011, but rather to put together a holistic cyber security policy appropriate ~~to~~for its organization. The assessment through the Compliance Monitoring and Enforcement Program of policy items that extend beyond the scope of CIP-004 through CIP-011 should not be considered candidates for potential violations. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

1.1 Personnel & training (CIP-004)

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account management

1.2 Electronic Security Perimeters (CIP-005) including Interactive Remote Access

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points
- Maintaining up-to-date anti-malware software before initiating Interactive Remote Access
- Maintaining up-to-date patch levels for operating systems and applications used to initiate Interactive Remote Access
- Disabling VPN "split-tunneling" or "dual-homed" workstations before initiating Interactive Remote Access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity's Interactive Remote Access controls

1.3 Physical security of BES Cyber Systems (CIP-006)

- Strategy for protecting Cyber Assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress

1.4 System security management (CIP-007)

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

1.5 Incident reporting and response planning (CIP-008)

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

1.6 Recovery plans for BES Cyber Systems (CIP-009)

- Availability of spare components

- Availability of system backups

1.7 Configuration change management and vulnerability assessments (CIP-010)

- Initiation of change requests
- Approval of changes
- Break-fix processes

1.8 Information protection (CIP-011)

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

1.9 Declaring and responding to CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The Standard Drafting Team (SDT) has removed requirements relating to exceptions to a Responsible Entity's security policies since it is a general management issue that is not within the scope of a reliability requirement. The SDT considers it to be an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy.

In this and all subsequent required approvals in the NERC CIP Reliability Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R2:

As with Requirement R1, the number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization or as components of specific programs. The cyber security policy must cover in sufficient detail the four topical areas required by CIP-003-~~5~~6, Requirement R2. The Responsible Entity has flexibility to develop a single comprehensive cyber security policy covering these topics, or it may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In the case of a high-level umbrella policy, the Responsible Entity would be expected to provide the high-level policy as well as the additional documentation in order to demonstrate compliance with CIP-003-~~5~~6, Requirement R2. The intent of the requirement is to outline a set of basic protections that all low impact BES Cyber Systems should receive without requiring a significant administrative and compliance overhead. The SDT intends that demonstration of this requirement can be reasonably accomplished through providing evidence of related processes, procedures, or plans. While the audit staff may choose to review an example low impact BES Cyber System, the SDT believes strongly that the current method (as of this writing) of reviewing a statistical sample of systems

is not necessary. The SDT also notes that in topic 2.3, the SDT uses the term "electronic access control" in the general sense, i.e., to control access, and not in the specific technical sense requiring authentication, authorization, and auditing.

Requirement R3:

The intent of CIP-003-~~5~~6, Requirement R3 is effectively unchanged since prior versions of the standard. The specific description of the CIP Senior Manager has now been included as a defined term rather than clarified in the Standard itself to prevent any unnecessary cross-reference to this standard. It is expected that ~~this~~the CIP Senior Manager will play a key role in ensuring proper strategic planning, executive/board-level awareness, and overall program governance.

Requirement R4:

As indicated in the rationale for CIP-003-~~5~~6, Requirement R4, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the SDT was not to impose any particular organizational structure, but, rather, the intent is to afford the Responsible Entity ~~should have~~ significant flexibility to adapt this requirement to ~~their~~its existing organizational structure. A Responsible Entity may satisfy this requirement through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to its organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records ~~provides~~shows a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

The Responsible Entity must keep its documentation of the CIP Senior Manager and any delegations up~~-~~to~~-~~date. This is to ensure that individuals do not assume any undocumented authority. However, delegations do not have to be re-instated if the individual who delegated the task changes roles or the individual is replaced. For instance, assume that John Doe is named the CIP Senior Manager and he delegates a specific task to the Substation Maintenance Manager. If John Doe is replaced as the CIP Senior Manager, the CIP Senior Manager documentation must be updated within the specified timeframe, but the existing delegation to the Substation Maintenance Manager remains in effect as approved by the previous CIP Senior Manager, John Doe.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-004-6.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to

provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-6 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or

CIP-004-6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			• indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-6 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-6 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
			content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2)	The Responsible Entity implemented a cyber security training program but failed to train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train two individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	The Responsible Entity implemented a cyber security training program but failed to train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train three individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	The Responsible Entity implemented a cyber security training program but failed to include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last

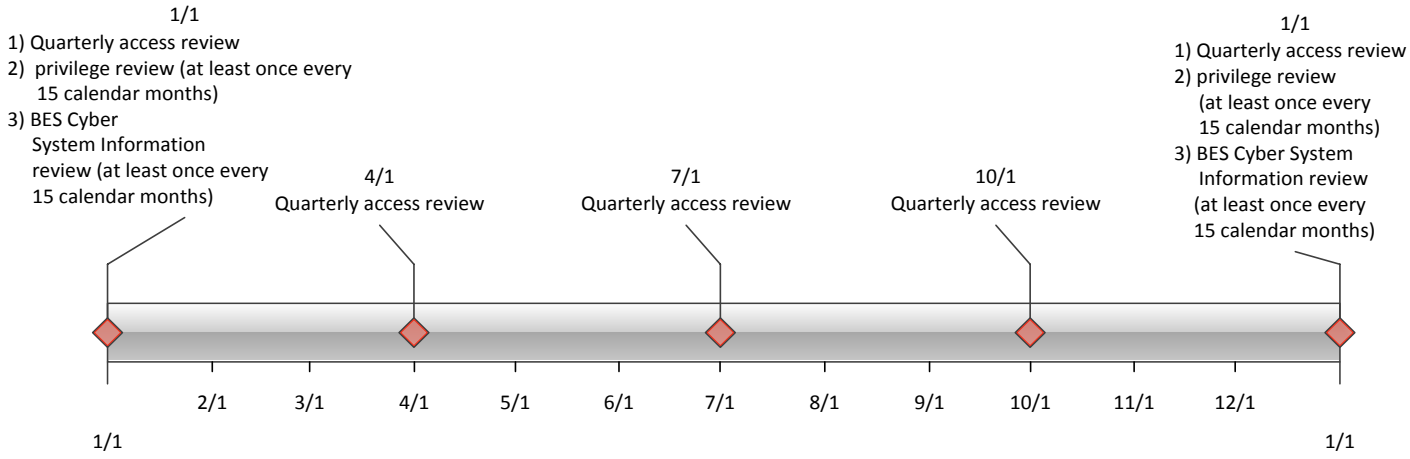
PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the

individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

~~**Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.**~~

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. ~~3.~~ Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~an additional comment and ballot to ballot the removal of "identify, assess, and correct" language~~final ballot. The draft includes modifications to meet FERC Order No. 791 directive~~s to remove or modify the "identify, assess, and correct" language from CIP-004~~.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~September 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
~~X~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~X~~6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~X~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-004-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction~~See Implementation Plan for CIP-004-6.

6. Background:

Standard CIP-004 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the ~~requirement's~~ common subject matter of the requirements.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~X~~ 6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Security awareness that, at least once each calendar quarter, reinforces cyber security practices (which may include associated physical security practices) for the Responsible Entity's personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Systems.	An example of evidence may include, but is not limited to, documentation that the quarterly reinforcement has been provided. Examples of evidence of reinforcement may include, but are not limited to, dated copies of information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for

CIP-004-~~X~~ 6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
			example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

Rationale for Requirement R2:

To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

R2. Each Responsible Entity shall implement one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~X~~ 6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~X~~ 6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

Rationale for Requirement R3:

To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.

R3. Each Responsible Entity shall implement one or more documented personnel risk assessment program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.

CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process to evaluate criminal history records checks for authorizing access.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to evaluate criminal history records checks.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted according to Parts 3.1 through 3.3.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's criteria or process for verifying contractors or service vendors personnel risk assessments.

CIP-004-~~X~~ 6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

Rationale for Requirement R4:

To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-~~X~~6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-~~X~~6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

R4. Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R4 – Access Management Program. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~X~~ 6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

CIP-004-~~X~~ 6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

CIP-004-~~X~~ 6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

CIP-004-~~X~~ 6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

Rationale for Requirement R5:

The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

R5. Each Responsible Entity shall implement one or more documented access revocation program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R5 – Access Revocation*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~X~~ 6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~X~~ 6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

CIP-004-~~X~~ 6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

CIP-004-~~X~~ 6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

CIP-004-~~X~~ 6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

CIP-004-~~X~~ 6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-004-~~X~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Lower**	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so between 10 and 30 calendar days after the start of a subsequent calendar quarter. (1.1)	The Responsible Entity did not reinforce cyber security practices during a calendar quarter but did so within the subsequent quarter but beyond 30 calendar days after the start of that calendar quarter. (1.1)	The Responsible Entity did not document or implement any security awareness process(es) to reinforce cyber security practices. (R1) OR The Responsible Entity did not reinforce cyber security practices and associated physical security practices for at least two consecutive calendar quarters. (1.1)
R2	**Operations Planning**	**Lower**	The Responsible Entity implemented a cyber security training program but failed to include one of the training	The Responsible Entity implemented a cyber security training program but failed to include two of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity implemented a cyber security training program but failed to include three of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR	The Responsible Entity did not implement a cyber security training program appropriate to individual roles, functions, or responsibilities. (R2) OR The Responsible Entity

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last

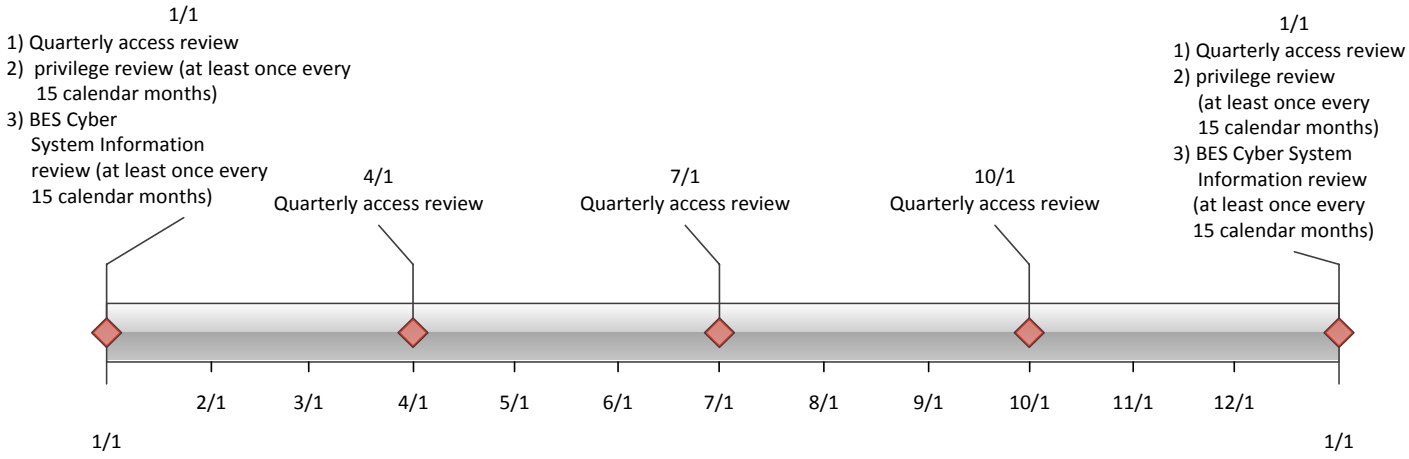
PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the

individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014

3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives

4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014
~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

Effective Dates

1. **24 Months Minimum –** CIP-004-5.1 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-004-5.1 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	~~12/30/10~~1/24/11	~~Modified to add specific criteria for Critical Asset identification.~~ Approved by the NERC Board of Trustees.	~~Update~~
~~4~~5	~~1/24/~~11/26/12	~~Approved~~Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-004-5.	
5.1	9/30/13	Modified two VSLs in R4	Errata

~~Definitions of Terms Used in the Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-~~5.1~~6

3. **Purpose:** To minimize the risk against compromise that could lead to misoperation or instability in the Bulk Electric System (BES) from individuals accessing BES Cyber Systems by requiring an appropriate level of personnel risk assessment, training, and security awareness in support of protecting BES Cyber Systems.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

   4.1.1. Balancing Authority

   4.1.2. Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

   4.1.2.1. Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

   4.1.2.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

   4.1.2.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

   4.1.2.2. Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

   4.1.2.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

   4.1.3. Generator Operator

   4.1.4. Generator Owner

4.1.5. Interchange Coordinator or Interchange Authority

4.1.6. Reliability Coordinator

4.1.7. Transmission Operator

4.1.8. Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1. Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1. Each UFLS or UVLS System that:

4.2.1.1.1. is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2. performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2. Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3. Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4. Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2. Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3. Exemptions: The following are exempt from Standard CIP-004-~~5.1~~6:

4.2.3.1. Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2. Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3. The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4. For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5. Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-004-6.

6. Background:

Standard CIP-004 ~~5.1~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1~~ and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.~~ This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~]~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the ~~requirement's~~ common subject matter of the requirements.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements in the table~~. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities~~.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a

response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes

Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

~~**Rationale for R1:** Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.~~

~~**Summary of Changes:** Reformatted into table structure.~~

Rationale for Requirement R1:

Ensures that Responsible Entities with personnel who have authorized electronic or authorized unescorted physical access to BES Cyber Assets take action so that those personnel with such authorized electronic or authorized unescorted physical access maintain awareness of the Responsible Entity's security practices.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R1 – Security Awareness Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
		authorized unescorted physical access to BES Cyber Systems.	information used to reinforce security awareness, as well as evidence of distribution, such as: • direct communications (for example, e-mails, memos, computer-based training); or • indirect communications (for example, posters, intranet, or brochures); or • management support and reinforcement (for example, presentations or meetings).

~~Reference to prior version:~~ ~~*CIP-004-4, R1*~~	**~~Change~~ Rationale~~: *Changed to remove*~~ for Requirement R2:** To ensure that the Responsible Entity's training program for personnel who need ~~*to ensure or prove everyone with*~~ authorized electronic access and/or authorized unescorted physical access ~~*"received" ongoing reinforcement – to state that security awareness has been reinforced.*~~ ~~*Moved example mechanisms to guidance.*~~to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.

~~Rationale for R2:~~ ~~To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems covers the proper policies, access controls, and procedures to protect BES Cyber Systems and are trained before access is authorized.~~

~~Based on their role, some personnel may not require training on all topics.~~

~~Summary of Changes:~~

~~1. Addition of specific role training for:~~

- ~~The visitor control program~~
- ~~Electronic interconnectivity supporting the operation and control of BES Cyber Systems~~
- ~~Storage media as part of the handling of BES Cyber Systems information~~

~~2. Change references from Critical Cyber Assets to BES Cyber Systems.~~

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies, a~~ one or more cyber security training program(s) appropriate to individual roles, functions, or responsibilities that collectively includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Training content on: 2.1.1. Cyber security policies; 2.1.2. Physical access controls; 2.1.3. Electronic access controls; 2.1.4. The visitor control program; 2.1.5. Handling of BES Cyber System Information and its storage; 2.1.6. Identification of a Cyber Security Incident and initial notifications in accordance with the entity's incident response plan; 2.1.7. Recovery plans for BES Cyber Systems; 2.1.8. Response to Cyber Security Incidents; and 2.1.9. Cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Examples of evidence may include, but are not limited to, training material such as power point presentations, instructor notes, student notes, handouts, or other training materials.

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
~~**Reference to prior version:**~~ ~~*CIP004-4, R2.2.1*~~		~~**Change Rationale:** *Removed "proper use of Critical Cyber Assets" concept from previous versions to focus the requirement on cyber security issues, not the business function. The previous version was focused more on the business or functional use of the BES Cyber System and is outside the scope of cyber security. Personnel who will administer the visitor control process or serve as escorts for visitors need training on the program. Core training on the handling of BES Cyber System (not Critical Cyber Assets) Information, with the addition of storage; FERC Order No. 706, paragraph 413 and paragraphs 632-634, 688, 732-734; DHS 2.4.16. Core training on the identification and reporting of a Cyber Security Incident; FERC Order No. 706, Paragraph 413; Related to CIP-008-5 & DHS Incident Reporting requirements for those with roles in incident reporting. Core training on the action plans and procedures to recover or re-establish BES Cyber Systems for personnel having a role in the recovery; FERC Order No. 706, Paragraph 413. Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems; FERC Order No. 706, Paragraph 434.*~~	

CIP-004-~~5.1~~6 Table R2 – Cyber Security Training Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 prior to granting authorized electronic access and authorized unescorted physical access to applicable Cyber Assets, except during CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, training records and documentation of when CIP Exceptional Circumstances were invoked.
~~**Reference to prior version:**~~ ~~*CIP004-4, R2.1*~~		~~**Change Rationale:** *Addition of exceptional circumstances parameters as directed in FERC Order No. 706, Paragraph 431 is detailed in CIP-003-5.*~~	
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Require completion of the training specified in Part 2.1 at least once every 15 calendar months.	Examples of evidence may include, but are not limited to, dated individual training records.

~~Reference to prior version:~~	~~Change~~ Rationale~~: *Updated*~~ for Requirement R3:
~~*CIP004-4, R2.3*~~	To ensure that individuals who need authorized electronic or authorized unescorted physical access to ~~*replace "annually"*~~BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with ~~*"once every 15 calendar months."*~~ access must have had a personnel risk assessment completed within the last 7 years.

~~**Rationale for R3:** To ensure that individuals who need authorized electronic or authorized unescorted physical access to BES Cyber Systems have been assessed for risk. Whether initial access or maintaining access, those with access must have had a personnel risk assessment completed within the last 7 years.~~

~~**Summary of Changes:** Specify that the seven year criminal history check covers all locations where the individual has resided for six consecutive months or more, including current residence regardless of duration.~~

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented personnel risk assessment ~~programs~~program(s) to attain and retain authorized electronic or authorized unescorted physical access to BES Cyber Systems that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M3. Evidence must include the documented personnel risk assessment programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program* and additional evidence to demonstrate implementation of the program(s).

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to confirm identity.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to confirm identity.
~~**Reference to prior version:**~~ ~~*CIP004-4, R3.1*~~		~~**Change Rationale:** *Addressed interpretation request in guidance. Specified that process for identity confirmation is required. The implementation plan clarifies that a documented identity verification conducted under an earlier version of the CIP standards is sufficient.*~~	

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to perform a seven year criminal history records check as part of each personnel risk assessment that includes: 3.2.1. current residence, regardless of duration; and 3.2.2. other locations where, during the seven years immediately prior to the date of the criminal history records check, the subject has resided for six consecutive months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process to perform a seven year criminal history records check.

~~**Reference to prior version:**~~ ~~*CIP004-4, R3.1*~~CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program	~~**Change Rationale:** *Specify that the seven year criminal history check covers all locations where the individual has resided for six months or more, including current residence regardless of duration. Added additional wording based on interpretation request. Provision is made for when a full seven-year check cannot be performed.*~~

CIP-004-~~5.1~~6 Table R3 – Personnel Risk Assessment Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to ensure that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed according to Parts 3.1 to 3.4 within the last seven years.	An example of evidence may include, but is not limited to, documentation of the Responsible Entity's process for ensuring that individuals with authorized electronic or authorized unescorted physical access have had a personnel risk assessment completed within the last seven years.

~~Reference to prior version:~~

~~*CIP-004-3, R3, R3.3*~~

~~Change~~ Rationale~~: *Whether*~~ **for** ~~*initial access or maintaining access, establishes*~~**Requirement R4:**

To ensure that ~~*those*~~individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-6. "Provisioning" should be considered the actions to provide access to an individual.

Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must ~~*have had PRA completed within 7 years.*~~address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-6 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This ~~*covers both initial and renewal.*~~is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The ~~*implementation plan specifies that initial performance*~~focus of this requirement is ~~*7 years after the last personnel risk assessment*~~on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that ~~*was performed pursuant to a previous version of the CIP Cyber Security Standards for a personnel risk assessment.*~~ the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

~~Rationale for R4:~~ ~~To ensure that individuals with access to BES Cyber Systems and the physical and electronic locations where BES Cyber System Information is stored by the Responsible Entity have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and included in the delegations referenced in CIP-003-5. "Provisioning" should be considered the actions to provide access to an individual.~~

~~Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e., physical access control system, remote access system, directory services).~~

~~CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-5 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.~~

~~Quarterly reviews in Part 4.5 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to access the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.~~

~~If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that the error should not be considered a violation of this requirement.~~

~~For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.~~

~~Summary of Changes:~~ ~~The primary change was in pulling the access management requirements from CIP-003-4, CIP-004-4, and CIP-007-4 into a single requirement. The requirements from Version 4 remain largely unchanged except to clarify some terminology. The purpose for combining these requirements is to remove the perceived redundancy in authorization and review. The requirement in CIP-004-4 R4 to maintain a list of authorized personnel has been removed because the list represents only one form of evidence to demonstrate compliance that only authorized persons have access.~~

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access management ~~programs~~program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program. [Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Operations Planning and Same Day Operations].*

M4. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R4 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R4 – Access Management Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Process to authorize based on need, as determined by the Responsible Entity, except for CIP Exceptional Circumstances: 4.1.1. Electronic access; 4.1.2. Unescorted physical access into a Physical Security Perimeter; and 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	An example of evidence may include, but is not limited to, dated documentation of the process to authorize electronic access, unescorted physical access in a Physical Security Perimeter, and access to designated storage locations, whether physical or electronic, for BES Cyber System Information.

Reference to prior version: *CIP-003-4, R5.1 and R5.2; CIP-006-4, R1.5 and R4; CIP-007-4, R5.1 and R5.1.1*	**Change Rationale:** Combined requirements from CIP-003-4, CIP-007-4, and CIP-006-4 to make the authorization process clear and consistent. CIP-003-4, CIP-004-4, CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.CIP-004-5.16 Table R4 – Access Management Program

~~CIP-004-5.1 Table R4 – Access Management Program~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once each calendar quarter that individuals with active electronic access or unescorted physical access have authorization records.	Examples of evidence may include, but are not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access (i.e., workflow database) and a system generated list of personnel who have access (i.e., user account listing), or • Dated documentation of the verification between a list of individuals who have been authorized for access (i.e., authorization forms) and a list of individuals provisioned for access (i.e., provisioning forms or shared account listing).

~~**Reference to prior version:**~~ ~~*CIP-004-4, R4.1*~~	~~**Change Rationale:** *Feedback among team members, observers, and regional CIP auditors indicates there has been confusion in implementation around what the term "review" entailed in CIP-004-4, Requirement R4.1. This requirement clarifies the review should occur between the provisioned access and authorized access.*~~CIP-004-~~5~~.16 Table R4 – Access Management Program

~~CIP-004-5.1 Table R4 – Access Management Program~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For electronic access, verify at least once every 15 calendar months that all user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and are those that the Responsible Entity determines are necessary.	An example of evidence may include, but is not limited to, documentation of the review that includes all of the following: 1. A dated listing of all accounts/account groups or roles within the system; 2. A summary description of privileges associated with each group or role; 3. Accounts assigned to the group or role; and 4. Dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.

~~*Reference to prior version:*~~ ~~*CIP-007-4, R5.1.3*~~CIP-004-~~5.1~~6 Table R4 – Access Management Program	~~**Change Rationale:** *Moved requirements to ensure consistency and eliminate the cross-referencing of requirements. Clarified what was necessary in performing verification by stating the objective was to confirm that access privileges are correct and the minimum necessary.*~~

~~CIP-004-5.1 Table R4 – Access Management Program~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	Verify at least once every 15 calendar months that access to the designated storage locations for BES Cyber System Information, whether physical or electronic, are correct and are those that the Responsible Entity determines are necessary for performing assigned work functions.	An example of evidence may include, but is not limited to, the documentation of the review that includes all of the following: 1. A dated listing of authorizations for BES Cyber System information; 2. Any privileges associated with the authorizations; and 3. Dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.

~~Reference to prior version:~~ *~~CIP-003-4, R5.1.2~~*	**~~Change Rationale:~~** *~~Moved requirement to ensure consistency among access reviews. Clarified precise meaning of annual. Clarified what was necessary in performing a verification by stating the objective was to confirm access privileges are correct and the minimum necessary for performing assigned work functions.~~***Rationale for Requirement R5:** The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner. In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination. Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).

~~**Rationale for R5:** The timely revocation of electronic access to BES Cyber Systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.~~

~~In considering how to address directives in FERC Order No. 706 directing "immediate" revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (e.g., revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.~~

~~Access is physical, logical, and remote permissions granted to Cyber Assets composing the BES Cyber System or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (e.g., physical access control system, remote access system, directory services).~~

~~**Summary of Changes:** FERC Order No. 706, Paragraphs 460 and 461, state the following: "The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a Critical Cyber Asset for any reason (including disciplinary action, transfer, retirement, or termination).~~

~~As a general matter, the Commission believes that revoking access when an employee no longer needs it, either because of a change in job or the end of employment, must be immediate."~~

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented access revocation ~~programs~~program(s) that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation*. *[Violation Risk Factor: ~~Lower~~Medium] [Time Horizon: Same Day Operations and Operations Planning].*

M5. Evidence must include each of the applicable documented programs that collectively include each of the applicable requirement parts in *CIP-004-~~5.1~~6 Table R5 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-~~5.1~~6 Table R5 – Access Revocation			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	A process to initiate removal of an individual's ability for unescorted physical access and Interactive Remote Access upon a termination action, and complete the removals within 24 hours of the termination action (Removal of the ability for access may be different than deletion, disabling, revocation, or removal of all access rights).	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form verifying access removal associated with the termination action; and 2. Logs or other demonstration showing such persons no longer have access.

~~Reference to prior version:~~ **CIP-004-**~~4, R4.2~~6 Table R5 – Access Revocation	**~~Change Rationale:~~** ~~*The FERC Order No. 706, Paragraphs 460 and 461, directs modifications to the Standards* **to require immediate revocation** *for any person no longer needing access. To address this directive, this requirement specifies revocation concurrent with the termination instead of within 24 hours.*~~

~~CIP-004-5.1 Table R5 – Access Revocation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For reassignments or transfers, revoke the individual's authorized electronic access to individual accounts and authorized unescorted physical access that the Responsible Entity determines are not necessary by the end of the next calendar day following the date that the Responsible Entity determines that the individual no longer requires retention of that access.	An example of evidence may include, but is not limited to, documentation of all of the following: 1. Dated workflow or sign-off form showing a review of logical and physical access; and 2. Logs or other demonstration showing such persons no longer have access that the Responsible Entity determines is not necessary.

~~Reference to prior version:~~ **CIP-004-~~4, R4.2~~6 Table R5 – Access Revocation**	**~~Change Rationale:~~** *~~FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access, including transferred employees. In reviewing how to modify this requirement, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 Version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.~~*

~~CIP-004-5.1 Table R5 – Access Revocation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PACS	For termination actions, revoke the individual's access to the designated storage locations for BES Cyber System Information, whether physical or electronic (unless already revoked according to Requirement R5.1), by the end of the next calendar day following the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System Information associated with the terminations and dated within the next calendar day of the termination action.

Reference to prior version: NEWCIP-004-5.16 Table R5 – Access Revocation	**Change Rationale:** *FERC Order No. 706, Paragraph 386, directs modifications to the standards to require prompt revocation of access to protected information. To address this directive, Responsible Entities are required to revoke access to areas designated for BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.*

~~CIP-004-5.1 Table R5 – Access Revocation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, revoke the individual's non-shared user accounts (unless already revoked according to Parts 5.1 or 5.3) within 30 calendar days of the effective date of the termination action.	An example of evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revocation of access and dated within thirty calendar days of the termination actions.

Reference to prior version: NEWCIP-004-5.16 Table R5 – Access Revocation	**Change Rationale:** FERC Order No. 706, Paragraph 460 and 461, direct modifications to the Standards to require immediate revocation for any person no longer needing access. In order to meet the immediate timeframe, Responsible Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate access revocation on individual Cyber Assets and applications without affecting reliability. This requirement provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.

~~CIP-004-5.1 Table R5 – Access Revocation~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: • EACMS	For termination actions, change passwords for shared account(s) known to the user within 30 calendar days of the termination action. For reassignments or transfers, change passwords for shared account(s) known to the user within 30 calendar days following the date that the Responsible Entity determines that the individual no longer requires retention of that access. If the Responsible Entity determines and documents that extenuating operating circumstances require a longer time period, change the password(s) within 10 calendar days following the end of the operating circumstances.	Examples of evidence may include, but are not limited to: • Workflow or sign-off form showing password reset within 30 calendar days of the termination; • Workflow or sign-off form showing password reset within 30 calendar days of the reassignments or transfers; or • Documentation of the extenuating operating circumstance and workflow or sign-off form showing password reset within 10 calendar days following the end of the operating circumstance.
~~**Reference to prior version:**~~ ~~*CIP-007-4, R5.2.3*~~		~~**Change Rationale:**~~ ~~*To provide clarification of expected actions in managing the passwords.*~~	

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority ~~(""~~ (CEA~~") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance ~~Audit~~Audits

Self-~~Certification~~Certifications

Spot Checking

Compliance ~~Investigation~~Violation Investigations

Self-Reporting

- ~~Complaint~~

Complaints

1.4. Additional Compliance Information:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reinforce security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms and evidence, when dated, which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the required items appropriate to personnel roles and responsibilities from Table R2. The Responsible Entity has the flexibility to define the training program and it may consist of multiple modules and multiple delivery mechanisms, but

a single training program for all individuals needing to be trained is acceptable. The training can focus on functions, roles or responsibilities at the discretion of the Responsible Entity.

One new element in the training content is intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems as per FERC Order No. 706, Paragraph 434. This is not intended to provide technical training to individuals supporting networking hardware and software, but educating system users of the cyber security risks associated with the interconnectedness of these systems. The users, based on their function, role, or responsibility, should have a basic understanding of which systems can be accessed from other systems and how the actions they take can affect cyber security.

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for CIP Exceptional Circumstances. To retain the authorized accesses, individuals must complete the training at least one every 15 months.

Requirement R3:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official or their delegate and impact the reliability of the BES or emergency response. Identity should be confirmed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. Identity only needs to be confirmed prior to initially granting access and only requires periodic confirmation according to the entity's process during the tenure of employment, which may or may not be the same as the initial verification action.

A seven year criminal history check should be performed for those locations where the individual has resided for at least six consecutive months. This check should also be performed in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven-year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, individuals who may have resided in locations from where it is not possible to obtain a criminal history records check, violates the law or is not allowed under the existing collective bargaining agreement. The Responsible Entity should consider the absence of information for the full seven years when assessing the risk of granting access during the process to evaluate the criminal history check. There needs to be a personnel risk assessment that has been completed within the last seven years for each individual with access. A new criminal history records check must be performed as part of the new PRA. Individuals who have been granted access under a previous version of these standards need a new PRA within seven years of the date of their last

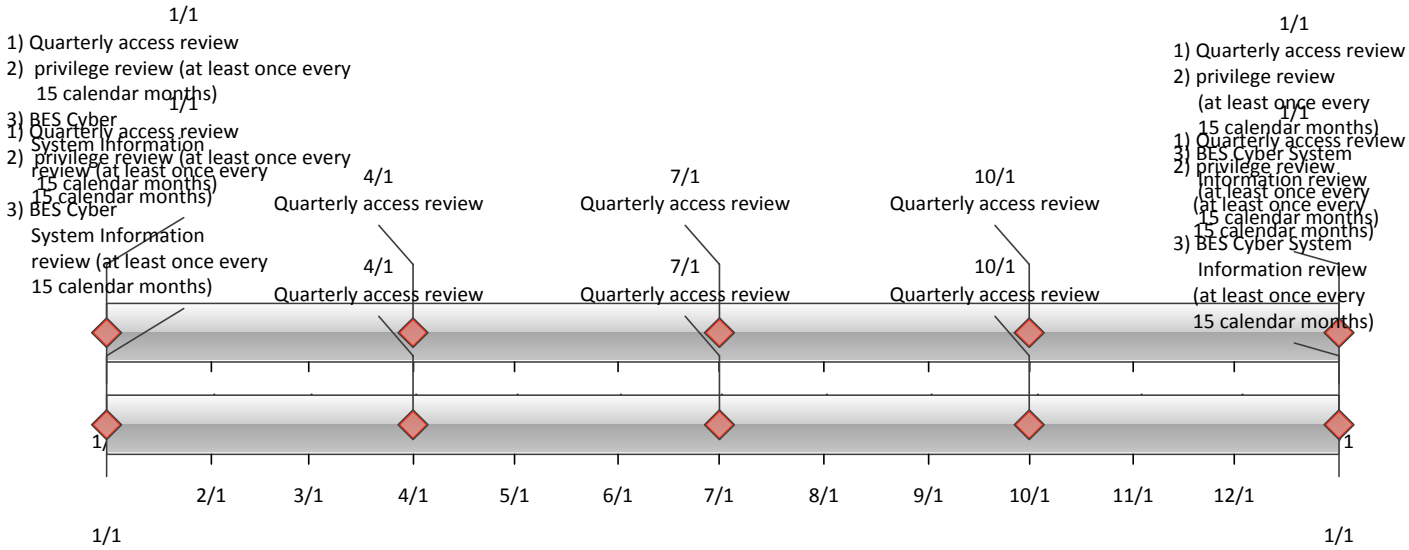
PRA. The clarifications around the seven year criminal history check in this version do not require a new PRA be performed by the implementation date.

Requirement R4:

Authorization for electronic and unescorted physical access and access to BES Cyber System Information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person where possible.

This requirement specifies both quarterly reviews and reviews at least once every 15 calendar months. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The privilege review at least once every 15 calendar months is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e., least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g., system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to



perform the privilege review on individual accounts. An example timeline of all the reviews in Requirement R4 is included below.

Separation of duties should be considered when performing the reviews in Requirement R4. The person reviewing should be different than the person provisioning access.

If the results of quarterly or at least once every 15 calendar months account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the SDT intends that this error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in Requirement R4 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R5:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common scenarios and possible processes on when the termination action occurs are provided in the following table. These scenarios are not an exhaustive list of all scenarios, but are representative of several routine business practices.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resources personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resources personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	Human resources personnel are notified of the death and work with appropriate personnel to begin the revocation process.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to

or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in Requirement R5.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts (i.e., accounts on the Cyber Asset itself) on BES Cyber Assets, then the Responsible Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents a Responsible Entity from performing all of the access revocation at the time of termination.

For transferred or reassigned individuals, a review of access privileges should be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

Requirement 5.5 specified that passwords for shared account are to the changed within 30 calendar days of the termination action or when the Responsible Entity determines an individual no longer requires access to the account as a result of a reassignment or transfer. The 30 days applies under normal operating conditions. However, circumstances may occur where this is not possible. Some systems may require an outage or reboot of the system in order to complete the password change. In periods of extreme heat or cold, many Responsible Entities may prohibit system outages and reboots in order to maintain reliability of the BES. When these circumstances occur, the Responsible Entity must document these circumstances and prepare to change the password within 10 calendar days following the end of the operating circumstances. Records of activities must be retained to show that the Responsible Entity followed the plan they created.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-6

3. Purpose: To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-006-6.

6. Background:

Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented

processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a Physical Security Perimeter (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.10	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning** **Same-Day Operations**	**Medium**	N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (1.2) OR The Responsible Entity has documented and implemented physical

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (1.3) OR The Responsible Entity does not have a process to monitor for unauthorized access through a physical access point into a Physical Security Perimeter. (1.4) OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a Physical Security Perimeter or to communicate such alerts within 15 minutes to identified personnel.

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						(1.5) OR The Responsible Entity does not have a process to monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control Systems. (1.6) OR The Responsible Entity does not have a process to alert for unauthorized physical access to Physical Access Control Systems or to communicate such alerts within 15 minutes to identified personnel. (1.7) OR The Responsible Entity does not have a process to log authorized physical entry into each

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						Physical Security Perimeter with sufficient information to identify the individual and date and time of entry. (1.8) OR The Responsible Entity does not have a process to retain physical access logs for 90 calendar days. (1.9) OR The Responsible Entity did not document or implement physical access restrictions, encryption, monitoring or equally effective logical protections for cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same

R #	Time Horizon	VRF	Violation Severity Levels (CIP-006-6)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, controls for a sole perimeter could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.

The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.

The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an “an equally effective logical protection” in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.

The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity’s BES Cyber Systems while not requiring controls to be

implemented on third-party components when entities rely on leased third-party communications.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for an additional comment period and ballotfinal ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Additional 45-Day Comment Period	August 2014
Final Ballot is Conducted	October/November 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	
~~6~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-6

3. Purpose: To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.~~

~~For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6~~See Implementation Plan for CIP-006-6.

6. Background:

Standard CIP-006 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for Requirement R1:

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a Physical Security Perimeter (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

R1. Each Responsible Entity shall implement one or more documented physical security plan(s) that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	Medium Impact BES Cyber Systems without External Routable Connectivity Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Define operational or procedural controls to restrict physical access.	An example of evidence may include, but is not limited to, documentation that operational or procedural controls exist.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Utilize at least one physical access control to allow unescorted physical access into each applicable Physical Security Perimeter to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes each Physical Security Perimeter and how unescorted physical access is controlled by one or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Where technically feasible, utilize two or more different physical access controls (this does not require two completely independent physical access control systems) to collectively allow unescorted physical access into Physical Security Perimeters to only those individuals who have authorized unescorted physical access.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the Physical Security Perimeters and how unescorted physical access is controlled by two or more different methods and proof that unescorted physical access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by access logs.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Monitor for unauthorized access through a physical access point into a Physical Security Perimeter.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized access through a physical access point into a Physical Security Perimeter.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Issue an alarm or alert in response to detected unauthorized access through a physical access point into a Physical Security Perimeter to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized access through a physical access control into a Physical Security Perimeter and additional evidence that the alarm or alert was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as manual or electronic alarm or alert logs, cell phone or pager logs, or other evidence that documents that the alarm or alert was generated and communicated.
1.6	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Monitor each Physical Access Control System for unauthorized physical access to a Physical Access Control System.	An example of evidence may include, but is not limited to, documentation of controls that monitor for unauthorized physical access to a PACS.

CIP-006-6 Table R1– Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.7	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Issue an alarm or alert in response to detected unauthorized physical access to a Physical Access Control System to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of the detection.	An example of evidence may include, but is not limited to, language in the physical security plan that describes the issuance of an alarm or alert in response to unauthorized physical access to Physical Access Control Systems and additional evidence that the alarm or alerts was issued and communicated as identified in the BES Cyber Security Incident Response Plan, such as alarm or alert logs, cell phone or pager logs, or other evidence that the alarm or alert was generated and communicated.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.8	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Log (through automated means or by personnel who control entry) entry of each individual with authorized unescorted physical access into each Physical Security Perimeter, with information to identify the individual and date and time of entry.	An example of evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into each Physical Security Perimeter and additional evidence to demonstrate that this logging has been implemented, such as logs of physical access into Physical Security Perimeters that show the individual and the date and time of entry into Physical Security Perimeter.

CIP-006-6 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.9	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain physical access logs of entry of individuals with authorized unescorted physical access into each Physical Security Perimeter for at least ninety calendar days.	An example of evidence may include, but is not limited to, dated documentation such as logs of physical access into Physical Security Perimeters that show the date and time of entry into Physical Security Perimeter.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.10	High Impact BES Cyber Systems and their associated: • PCA Medium Impact BES Cyber Systems at Control Centers and their associated: • PCA	Restrict physical access to cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement one or more documented visitor control program(s) that include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

CIP-006-6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require manual or automated logging of visitor entry into and exit from the Physical Security Perimeter that includes date and time of the initial entry and last exit, the visitor's name, and the name of an individual point of contact responsible for the visitor, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as dated visitor logs that include the required information.
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Retain visitor logs for at least ninety calendar days.	An example of evidence may include, but is not limited to, documentation showing logs have been retained for at least ninety calendar days.

Rationale for Requirement R3:

To ensure all Physical Access Control Systems and devices continue to function properly.

R3. Each Responsible Entity shall implement one or more documented Physical Access Control System maintenance and testing program(s) that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M3. Evidence must include each of the documented Physical Access Control System maintenance and testing programs that collectively include each of the applicable requirement parts in *CIP-006-6 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-6 Table R3 – Physical Access Control System Maintenance and Testing Program			
Part	**Applicable Systems**	**Requirement**	**Measures**
3.1	Physical Access Control Systems (PACS) associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity Locally mounted hardware or devices at the Physical Security Perimeter associated with: • High Impact BES Cyber Systems, or • Medium Impact BES Cyber Systems with External Routable Connectivity	Maintenance and testing of each Physical Access Control System and locally mounted hardware or devices at the Physical Security Perimeter at least once every 24 calendar months to ensure they function properly.	An example of evidence may include, but is not limited to, a maintenance and testing program that provides for testing each Physical Access Control System and locally mounted hardware or devices associated with each applicable Physical Security Perimeter at least once every 24 calendar months and additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus ~~is~~ of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances ~~this~~ a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, controls for a sole perimeter~~'s controls~~ could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person ~~they are~~the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-~~3~~ 2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.

The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.

The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an “an equally effective logical protection” in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.

The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity’s BES Cyber Systems while not requiring controls to be

implemented on third-party components when entities rely on leased third-party communications.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014

~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014
~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

Effective Dates

1. **24 Months Minimum –** CIP-006-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-006-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	~~TBD~~11/26/12	~~Modified to coordinate with other CIP standards and to revise format to use RBS Template.~~Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-006-5.	

~~Definitions of Terms Used in the Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-~~5~~6

3. Purpose: To manage physical access to Bulk Electric System (BES) Cyber Systems by specifying a physical security plan in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-006-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-006-6.

6. Background:

Standard CIP-006~~-5~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~].~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the~~

~~documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems without External Routable Connectivity** – Only applies to medium impact BES Cyber Systems without External Routable Connectivity.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Locally mounted hardware or devices at the Physical Security Perimeter –** Applies to the locally mounted hardware or devices (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) at a Physical Security Perimeter associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity, and that does not contain or store access control information or independently perform access authentication. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

~~**Rationale:** Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. *Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.7 and 1.8 beyond what is already required for the PSP.*~~

Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. Entities may choose for certain Physical Access Control Systems (PACS) to reside in a Physical Security Perimeter (PSP) controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement R1, Parts 1.1, 1.6 and 1.7 beyond what is already required for the PSP.

Regarding Requirement R1, Part 1.10, when cabling and other nonprogrammable components of a Control Center's communication network cannot be secured in a PSP, steps must be taken to ensure the integrity of the BES Cyber Systems. Exposed communication pathways outside of a PSP necessitate that physical or logical protections be installed to reduce the likelihood that man-in-the-middle attacks could compromise the integrity of their connected BES Cyber Assets or PCAs that are required to reside within PSPs. While it is anticipated that priority consideration will be given to physically securing the cabling and nonprogrammable communications components, the SDT understands that configurations arise when physical access restrictions are not ideal and Responsible Entities are able to reasonably defend their physically exposed communications components through specific additional logical protections.

~~**Summary of Changes:** The entire content of CIP-006-5 is intended to constitute a physical security program. This represents a change from previous versions, since there was no specific requirement to have a physical security program in previous versions of the standards, only requirements for physical security plans.~~

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented physical security ~~plans~~plan(s) that collectively include all of the applicable requirement parts in *CIP-006-~~5~~6 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations].*

M1. Evidence must include each of the documented physical security plans that collectively include all of the applicable requirement parts in *CIP-006-~~5~~6 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation of the plan or plans as described in the Measures column of the table.

Where physical access restrictions to such cabling and components are not implemented, the Responsible Entity shall document and implement one or more of the following: • encryption of data that transits such cabling and components; or • monitoring the status of the communication link composed of such cabling and components and issuing an alarm or alert in response to detected communication failures to the personnel identified in the BES Cyber Security Incident response plan within 15 minutes of detection; or • an equally effective logical protection.	An example of evidence may include, but is not limited to, records of the Responsible Entity's implementation of the physical access restrictions (e.g., cabling and components secured through conduit or secured cable trays) encryption, monitoring, or equally effective logical protections.

~~**Rationale:** To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.~~

~~**Summary of Changes:** Reformatted into table structure. Originally added in Version 3 per FERC Order issued September 30, 2009.~~

Rationale for Requirement R2:

To control when personnel without authorized unescorted physical access can be in any Physical Security Perimeters protecting BES Cyber Systems or Electronic Access Control or Monitoring Systems, as applicable in Table R2.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented visitor control ~~programs~~program(s) that include each of the applicable requirement parts in *CIP-006-~~5~~6 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M2. Evidence must include one or more documented visitor control programs that collectively include each of the applicable requirement parts in *CIP-006-~~5~~6 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-~~5~~6 Table R2 – Visitor Control Program			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; and 2. PCA	Require continuous escorted access of visitors (individuals who are provided access but are not authorized for unescorted physical access) within each Physical Security Perimeter, except during CIP Exceptional Circumstances.	An example of evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters and additional evidence to demonstrate that the process was implemented, such as visitor logs.

~~Reference to prior version:~~ **CIP-006-~~4c, R1~~ 6** ~~2~~ Table R2 – Visitor Control Program	**~~Change Description and Justification:~~** ~~*Added the ability to not do this during CIP Exceptional Circumstances.*~~

The SDT determined that annual testing was too often and agreed on two years.*~~	

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority~~ ("" (~~CEA"") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance ~~Audit~~Audits

Self-~~Certification~~Certifications

Spot Checking

Compliance ~~Investigation~~Investigations

Self-Reporting

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

General:

While the focus ~~is~~of this Reliability Standard has shifted away from the definition and management of a completely enclosed "six-wall" boundary, it is expected that in many instances ~~this~~a six-wall boundary will remain a primary mechanism for controlling, alerting, and logging access to BES Cyber Systems. Taken together, these controls outlined below will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods of physical access control include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.

- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Physical Security Perimeter.

Methods to monitor physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate, or window has been opened without authorization. These alarms must provide for notification within 15 minutes to individuals responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order No. 706, Paragraph 572, directive discussed utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Physical Security Perimeters, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, ~~a sole perimeter's~~ controls for a sole perimeter could include either a combination of card key and pin code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in combination with a guard-monitored remote camera and door release, where the "guard" has adequate information to authenticate the person ~~they are~~the guard is observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (e.g., key or card key) would provide access through both.

Entities may choose for certain PACS to reside in a PSP controlling access to applicable BES Cyber Systems. For these PACS, there is no additional obligation to comply with Requirement Parts 1.1, 1.~~7~~6 and 1.~~8~~7 beyond what is already required for the PSP.

The new requirement part CIP-006-6, Requirement R1, Part 1.10 responds to the directive found in FERC Order No. 791, Paragraph 150. The requirement intends to protect cabling and nonprogrammable communication components that are within an ESP, but extend outside of a PSP. This protection, similar to the FERC Approved NERC Petition on the interpretation on CIP-006-2 from PacifiCorp, must be accomplished either by physically protecting the cabling and components that leave a PSP (such as by conduit or secured cable trays) or through data encryption, circuit monitoring, or equally effective logical protections. It is intended that the

physical protections reduce the possibility of tampering or allowing direct access to the nonprogrammable devices. Conduit, secured cable trays, and secured communication closets are examples of these types of protections. These physical security measures should be implemented in such a way that they would provide some mechanism to detect or recognize that someone could have tampered with the cabling and non-programmable components. This could be something as simple as a padlock on a communications closet where the entity would recognize if the padlock had been cut off. Alternatively, this protection may also be accomplished through the use of armored cabling or via the stainless steel or aluminum tube protecting the fiber inside an optical ground wire (OPGW) cable. In using any of these methods, care should be taken to protect the entire length of the cabling including any termination points that may be outside of a defined PSP.

This requirement part only covers those portions of cabling and nonprogrammable communications components that are located outside of the PSP, but inside the ESP. Where this cabling and non-programmable communications components exist inside the PSP, this requirement part no longer applies.

The requirement focuses on physical protection of the communications cabling and components as this is a requirement in a physical security standard and the gap in protection identified by FERC in Order 791 is one of physical protections. However, the requirement part recognizes that there is more than one way to provide protection to communication cabling and nonprogrammable components. In particular, the requirement provides a mechanism for entities to select an alternative to physical security protection that may be chosen in a situation where an entity cannot implement physical security or simply chooses not to implement physical security. The entity is under no obligation to justify or explain why it chose logical protections over physical protections identified in the requirement.

The alternative protective measures identified in the CIP-006-6 R1, Part 1.10 (encryption and circuit monitoring) were identified as acceptable alternatives in NERC petition of the PacifiCorp Interpretation of CIP-006-2 which was approved by FERC (RD10-13-000). If an entity chooses to implement an “an equally effective logical protection” in lieu of one of the protection mechanisms identified in the standard, the entity would be expected to document how the protection is equally effective. NERC explained in its petition of the PacifiCorp Interpretation of CIP-006-2 that the measures are relevant to access or physical tampering. Therefore, the entity may choose to discuss how its protection may provide detection of tampering. The entity may also choose to explain how its protection is equivalent to the other logical options identified in the standard in terms of the CIA triad (confidentiality, integrity, and availability). The entity may find value in reviewing their plans prior to implementation with the regional entity, but there is no obligation to do so.

The intent of the requirement is not to require physical protection of third party components, consistent with FERC Order 791-A. The requirement allows flexibility in that the entity has control of how to design its ESP and also has the ability to extend its ESP outside its PSP via the logical mechanisms specified in CIP-006-6 Requirement 1, Part 1.10 such as encryption (which is an option specifically identified in FERC Order 791-A). These mechanisms should provide sufficient protections to an entity’s BES Cyber Systems while not requiring controls to be

implemented on third-party components when entities rely on leased third-party communications.

In addition to the cabling, the components in scope of this requirement part are those components outside of a PSP that could otherwise be considered a BES Cyber Asset or Protected Cyber Asset except that they do not meet the definition of Cyber Asset because they are nonprogrammable. Examples of these nonprogrammable components include, but are not limited to, unmanaged switches, hubs, patch panels, media converters, port savers, and couplers.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Physical Security Perimeter to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

The SDT also determined that a point of contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort, but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Physical Security Perimeter. This includes motion sensors, electronic lock control mechanisms, and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each SPS or RAS where the SPS or RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-007-6.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes.

These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

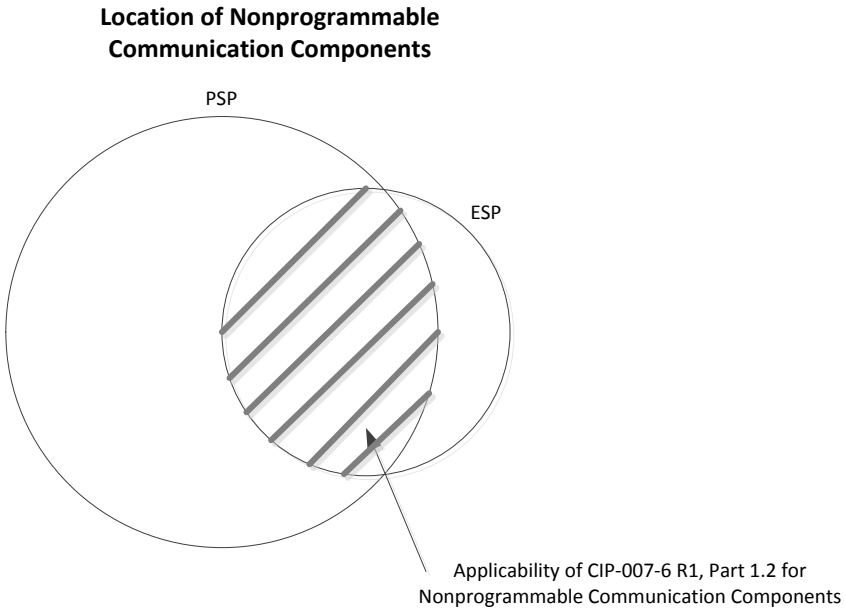
The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:



Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they

can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or

those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as “at next scheduled outage of at least two days duration.” “Mitigation plans” in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or

method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

~~**Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.**~~

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. ~~3.~~ Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~an additional comment and ballot to ballot the removal of "identify, assess, and correct" language~~final ballot. The draft includes modifications to meet the FERC Order No. 791 directive~~s to remove or modify the "identify, assess, and correct" language from CIP-007~~.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~September 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-007-5.	
~~X~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~X~~6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~X~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-007-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.~~

~~Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-X, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-X~~See Implementation Plan for CIP-007-6.

6. Background:

Standard CIP-007 exists as part of a suite of CIP Standards related to cyber security, which requires the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~X~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.

CIP-007-~~X~~ 6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~X~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.

CIP-007-~~X~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.

CIP-007-~~X~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~X~~ 6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

Rationale for Requirement R3:

Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~X~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Deploy method(s) to deter, detect, or prevent malicious code.	An example of evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (e.g., through traditional antivirus, system hardening, policies, etc.).

CIP-007-~~X~~ 6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Mitigate the threat of detected malicious code.	Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

Rationale for Requirement R4:

Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

R4. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~X~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.

CIP-007-~~X~~ 6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

Rationale for Requirement R5:

To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term “authorized” is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.

Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~X~~ 6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

						generate alerts after a threshold of unsuccessful authentication attempts. (5.7)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

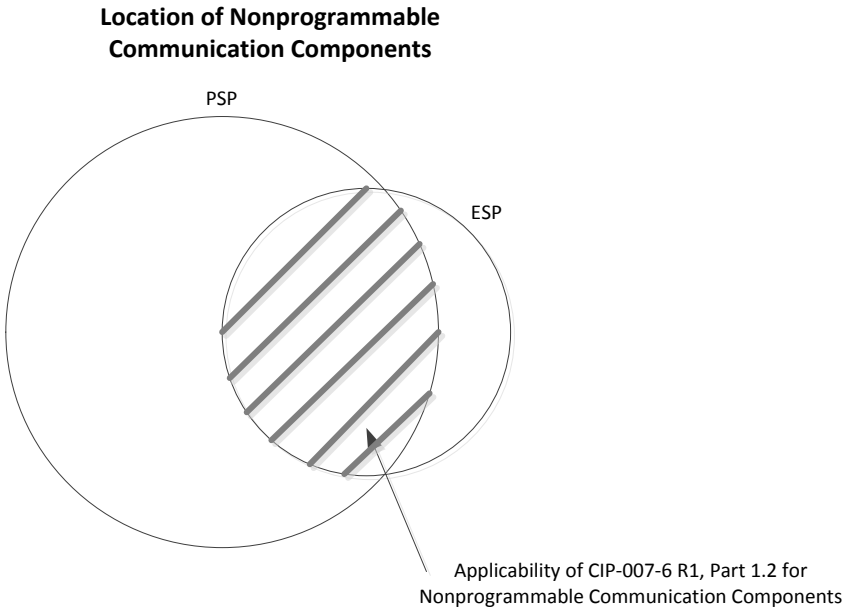
The protection of these ports can be accomplished in several ways including, but not limited to:

- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense ~~are~~ is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:~~.~~



Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. ~~Stand-alone~~Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where

security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related

patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor

the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail ~~etc~~etc.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014

~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

Effective Dates

1. **24 Months Minimum –** CIP-007-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.
2. In those jurisdictions where no regulatory approval is required, CIP-007-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated ~~version number~~Version Number from -2 to -3 ~~Approved by~~ In Requirement 1.6, deleted the ~~NERC Board of Trustees.~~ sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	~~12/30/10~~1/24/11	~~Modified to add specific criteria for Critical Asset identification.~~ Approved by the NERC Board of Trustees.	~~Update~~
~~4~~5	~~1/24/~~11/26/12	~~Approved~~Adopted by the NERC Board of Trustees.	~~Update~~Modified to coordinate with other CIP standards and to revise format to use RBS Template.

Version	Date	Action	Change Tracking
5	~~TBD~~11/22/13	~~Modified to coordinate with other CIP standards and to revise format to use RBS Template.~~FERC Order issued approving CIP-007-5.	

~~Definitions of Terms Used in the Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-~~5~~6

3. Purpose: To manage system security by specifying select technical, operational, and procedural requirements in support of protecting Bulk Electric System (BES) Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System (SPS) or Remedial Action Scheme (RAS) where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS where the ~~Special Protection System~~SPS or ~~Remedial Action Scheme~~RAS is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-007-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-007-6.

6. Background:

Standard CIP-007~~-5~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5~~, which requires the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~]~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the~~

~~documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to medium impact BES Cyber Systems located at a Control Center.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to medium impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System in the applicability column. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

~~**Rationale for R1:** The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.~~

~~**Summary of Changes:** Changed the 'needed for normal or emergency operations' to those ports that are needed. Physical I/O ports were added in response to a FERC order. The unneeded physical ports in Control Centers (which are the highest risk, most impactful areas) should be protected as well.~~

Rationale for Requirement R1:

The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and services and physical I/O ports.

In response to FERC Order No. 791, specifically FERC's reference to NIST 800-53 rev. 3 security control PE-4 in paragraph 149, Part 1.2 has been expanded to include PCAs and nonprogrammable communications components. This increase in applicability expands the scope of devices that receive the protection afforded by the defense-in-depth control included in Requirement R1, Part 1.2.

The applicability is limited to those nonprogrammable communications components located both inside a PSP and an ESP in order to allow for a scenario in which a Responsible Entity may implement an extended ESP (with corresponding logical protections identified in CIP-006, Requirement R1, Part 1.10). In this scenario, nonprogrammable components of the communication network may exist out of the Responsible Entity's control (i.e. as part of the telecommunication carrier's network).

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R1 – Ports and Services*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations.]*

M1. Evidence must include the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R1 – Ports and Services* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	Examples of evidence may include, but are not limited to: • Documentation of the need for all enabled ports on all applicable Cyber Assets and Electronic Access Points, individually or by group. • Listings of the listening ports on the Cyber Assets, individually or by group, from either the device configuration files, command output (such as netstat), or network scans of open ports; or • Configuration files of host-based firewalls or other device level mechanisms that only allow needed ports and deny all others.
~~**Reference to prior version:** *CIP-007-4, R2.1 and R2.2*~~		~~**Change Description and Justification:** *The requirement focuses on the entity knowing and only allowing those ports that are necessary. The additional classification of 'normal or emergency' added no value and has been removed.*~~	

CIP-007-~~5~~6 Table R1– Ports and Services			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP. Medium Impact BES Cyber Systems at Control Centers and their associated: 1. PCA; and 2. Nonprogrammable communication components located inside both a PSP and an ESP.	Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	An example of evidence may include, but is not limited to, documentation showing types of protection of physical input/output ports, either logically through system configuration or physically using a port lock or signage.
~~**Reference to prior version:** *NEW*~~		~~**Change Description and Justification:** *On March 18, 2010, FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.*~~	

~~**Rationale for R2:** Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.~~

~~The remediation plan can be updated as necessary to maintain the reliability of the BES, including an explanation of any rescheduling of the remediation actions.~~

~~**Summary of Changes:** The existing wordings of CIP-007, Requirements R3, R3.1, and R3.2, were separated into individual line items to provide more granularity. The documentation of a source(s) to monitor for release of security related patches, hot fixes, and/or updates for BES Cyber System or BES Cyber Assets was added to provide context as to when the "release" date was. The current wording stated "document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades" and there has been confusion as to what constitutes the availability date. Due to issues that may occur regarding Control System vendor license and service agreements, flexibility must be given to Responsible Entities to define what sources are being monitored for BES Cyber Assets.~~

Rationale for Requirement R2:

Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R2 – Security Patch Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R2 – Security Patch Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	An example of evidence may include, but is not limited to, documentation of a patch management process and documentation or lists of sources that are monitored, whether on an individual BES Cyber System or Cyber Asset basis.
~~**Reference to prior version:**~~ ~~*CIP-007, R3*~~		~~**Change Rationale:** *The requirement is brought forward from previous CIP versions with the addition of defining the source(s) that a Responsible Entity monitors for the release of security related patches. Documenting the source is used to determine when the assessment timeframe clock starts. This requirement also handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system.*~~	

CIP-007-~~5~~6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 35 calendar days, evaluate security patches for applicability that have been released since the last evaluation from the source or sources identified in Part 2.1.	An example of evidence may include, but is not limited to, an evaluation conducted by, referenced by, or on behalf of a Responsible Entity of security-related patches released by the documented sources at least once every 35 calendar days.
~~**Reference to prior version:**~~ ~~*CIP-007, R3.1*~~		~~**Change Rationale:** *Similar to the current wording but added "from the source or sources identified in 2.1" to clarify the 35-day time frame.*~~	

CIP-007-~~5~~6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For applicable patches identified in Part 2.2, within 35 calendar days of the evaluation completion, take one of the following actions: • Apply the applicable patches; or • Create a dated mitigation plan; or • Revise an existing mitigation plan. Mitigation plans shall include the Responsible Entity's planned actions to mitigate the vulnerabilities addressed by each security patch and a timeframe to complete these mitigations.	Examples of evidence may include, but are not limited to: • Records of the installation of the patch (e.g., exports from automated patch management tools that provide installation date, verification of BES Cyber System Component software revision, or registry exports that show software has been installed); or • A dated plan showing when and how the vulnerability will be addressed, to include documentation of the actions to be taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch and a timeframe for the completion of these mitigations.

CIP-007-~~5~~6 Table R2 – Security Patch Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
~~Reference to prior version:~~ ~~*CIP-007, R3.2*~~		**~~Change Rationale:~~** ~~*The requirement has been changed to handle the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. The mitigation plan may, and in many cases will, consist of installing the patch. However, there are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability.*~~	
2.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For each mitigation plan created or revised in Part 2.3, implement the plan within the timeframe specified in the plan, unless a revision to the plan or an extension to the timeframe specified in Part 2.3 is approved by the CIP Senior Manager or delegate.	An example of evidence may include, but is not limited to, records of implementation of mitigations.

~~Reference to prior version:~~ ~~*CIP-007, R3.2*~~	**~~Change~~ Rationale~~:~~ ~~*Similar to*~~ for Requirement R3:** Malicious code prevention has the ~~*current wording but added that*~~purpose of limiting and detecting the ~~*plan must be implemented within*~~addition of malicious code onto the ~~*timeframe specified in*~~applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the ~~*plan,*~~availability or ~~*in a revised plan as approved by*~~integrity of the ~~*CIP Senior Manager or delegate.*~~ BES Cyber System.

~~**Rationale for R3:** Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable Cyber Assets of a BES Cyber System. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.~~

~~**Summary of Changes:** In prior versions, this requirement has arguably been the single greatest generator of TFEs as it prescribed a particular technology to be used on every CCA regardless of that asset's susceptibility or capability to use that technology. As the scope of Cyber Assets in scope of these standards expands to more field assets, this issue will grow exponentially. The drafting team is taking the approach of making this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every Cyber Asset. The BES Cyber System is the object of protection.~~

~~Beginning in Paragraphs 619-622 of FERC Order No. 706, and in particular Paragraph 621, FERC agrees that the standard "does not need to prescribe a single method…However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance…"~~

~~In Paragraph 622, FERC directs that the requirement be modified to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software through remote access, electronic media, or other means. The drafting team believes that addressing this issue holistically at the BES Cyber System level and regardless of technology, along with the enhanced change management requirements, meets this directive.~~

R3. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations].*

M3. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R3 – Malicious Code Prevention* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~6 Table R3 – Malicious Code Prevention

Examples of evidence may include, but are not limited to: • Records of response processes for malicious code detection • Records of the performance of these processes when malicious code is detected.
~~**Reference to prior version:**~~ ~~*CIP-007-4, R4*~~ ~~*CIP-007-4, R4.1*~~		~~**Change Rationale:** *See the Summary of Changes.*~~	

CIP-007-~~5~~6 Table R3 – Malicious Code Prevention			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For those methods identified in Part 3.1 that use signatures or patterns, have a process for the update of the signatures or patterns. The process must address testing and installing the signatures or patterns.	An example of evidence may include, but is not limited to, documentation showing the process used for the update of signatures or patterns.

~~Reference to prior version:~~ ~~*CIP-007-4, R4; CIP-007-4, R4.2*~~	**~~Change~~ Rationale~~:~~ for Requirement** ~~*essentially unchanged from previous versions; updated*~~**R4:** Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to ~~*refer to previous parts of the*~~ support post-event data analysis. Audit processing failures are not penalized in this requirement ~~*table.*~~. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.

~~**Rationale for R4:** Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems, and comprises of the activities involved with the collection, processing, alerting and retention of security related computer logs. These logs can provide both (1) the detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security related logs is intended to support post event data analysis.~~

~~Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor for and notify personnel of audit processing failures.~~

~~**Summary of Changes:** Beginning in Paragraph 525 and also Paragraph 628 of the FERC Order No. 706, the Commission directs a manual review of security event logs on a more periodic basis. This requirement combines CIP-005-4, R5 and CIP-007-4, R6 and addresses both directives from a system-wide perspective. The primary feedback received on this requirement from the informal comment period was the vagueness of terms "security event" and "monitor."~~

~~The term "security event" or "events related to cyber security" is problematic because it does not apply consistently across all platforms and applications. To resolve this term, the requirement takes an approach similar to NIST 800-53 and requires the entity to define the security events relevant to the System. There are a few events explicitly listed that if a Cyber Asset or BES Cyber System can log, then it must log.~~

~~In addition, this requirement sets up parameters for the monitoring and reviewing of processes. It is rarely feasible or productive to look at every security log on the system. Paragraph 629 of the FERC Order No. 706 acknowledges this reality when directing a manual log review. As a result, this requirement allows the manual review to consist of a sampling or summarization of security events occurring since the last review.~~

R4. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R4 – Security Event Monitoring*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment.]*

M4. Evidence must include each of the documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R4 – Security Event Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	Examples of evidence may include, but are not limited to, a paper or system generated listing of event types for which the BES Cyber System is capable of detecting and, for generated events, is configured to log. This listing must include the required types of events.
~~**Reference to prior version:**~~ ~~*CIP-005-4, R3; CIP-007-4, R5, R5.1.2, R6.1, andR6.3*~~		~~**Change Description and Justification:** *This requirement is derived from NIST 800-53 version 3 AU-2, which requires organizations to determine system events to audit for incident response purposes. The industry expressed confusion in the term "system events related to cyber security" from informal comments received on CIP-011. Access logs from the ESP as required in CIP-005-4 Requirement R3 and user access and activity logs as required in CIP-007-5 Requirement R5 are also included here.*~~	

CIP-007-~~5~~6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Generate alerts for security events that the Responsible Entity determines necessitates an alert, that includes, as a minimum, each of the following types of events (per Cyber Asset or BES Cyber System capability): 4.2.1. Detected malicious code from Part 4.1; and 4.2.2. Detected failure of Part 4.1 event logging.	Examples of evidence may include, but are not limited to, paper or system-generated listing of security events that the Responsible Entity determined necessitate alerts, including paper or system generated list showing how alerts are configured.
~~**Reference to prior version:**~~ ~~*CIP-005-4, R3.2; CIP-007-4, R6.2*~~		~~**Change Description and Justification:** *This requirement is derived from alerting requirements in CIP-005-4, Requirement R3.2 and CIP-007-4, Requirement R6.2 in addition to NIST 800-53 version 3 AU-6. Previous CIP Standards required alerting on unauthorized access attempts and detected Cyber Security Incidents, which can be vast and difficult to determine from day to day. Changes to this requirement allow the entity to determine events that necessitate a response.*~~	

CIP-007-~~5~~6 Table R4 – Security Event Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	Examples of evidence may include, but are not limited to, documentation of the event log retention process and paper or system generated reports showing log retention configuration set at 90 days or greater.
~~**Reference to prior version:** *CIP-005-4, R3.2; CIP-007-4, R6.4*~~		~~**Change Rationale:** *No substantive change.*~~	
4.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Review a summarization or sampling of logged events as determined by the Responsible Entity at intervals no greater than 15 calendar days to identify undetected Cyber Security Incidents.	Examples of evidence may include, but are not limited to, documentation describing the review, any findings from the review (if any), and dated documentation showing the review occurred.

~~Reference to prior version:~~ *~~CIP-005-4, R3.2; CIP-007-4, R6.5~~*	**~~Change Description and Justification:~~** *~~Beginning in Paragraph 525 and also 628 of the FERC Order No. 706, the Commission directs a manual review of security event logs on a more periodic basis and suggests a weekly review. The Order acknowledges it is rarely feasible to review all system logs. Indeed, log review is a dynamic process that should improve over time and with additional threat information. Changes to this requirement allow for an approximately biweekly summary or sampling review of logs.~~* **Rationale for Requirement R5:** To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised. Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time. Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.

	Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term "authorized" is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement. Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords. For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

~~Rationale for R5:~~ ~~To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. Requirement R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.~~

~~Requirement Part 5.1 ensures the BES Cyber System or Cyber Asset authenticates individuals that can modify configuration information. This requirement addresses the configuration of authentication. The authorization of individuals is addressed elsewhere in the CIP Cyber Security Standards. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.~~

~~Requirement Part 5.2 addresses default and other generic account types. Identifying the use of default or generic account types that could introduce vulnerabilities has the benefit ensuring entities understand the possible risk these accounts pose to the BES Cyber System. The Requirement Part avoids prescribing an action to address these accounts because the most effective solution is situation specific, and in some cases, removing or disabling the account could have reliability consequences.~~

~~Requirement Part 5.3 addresses identification of individuals with access to shared accounts. This Requirement Part has the objective of mitigating the risk of unauthorized access through shared accounts. This differs from other CIP Cyber Security Standards Requirements to authorize access. An entity can authorize access and still not know who has access to a shared account. Failure to identify individuals with access to shared accounts would make it difficult to revoke access when it is no longer needed. The term "authorized" is used in the requirement to make clear that individuals storing, losing, or inappropriately sharing a password is not a violation of this requirement.~~

~~Requirement 5.4 addresses default passwords. Changing default passwords closes an easily exploitable vulnerability in many systems and applications. Pseudo-randomly system generated passwords are not considered default passwords.~~

~~For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.~~

~~The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.~~

~~The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.~~

~~The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.~~

~~Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.~~

~~Summary of Changes (From R5):~~

~~CIP-007-4, Requirement R5.3 requires the use of passwords and specifies a specific policy of six characters or more with a combination of alpha-numeric and special characters. The level of detail in these requirements can restrict more effective security measures. For example, many have interpreted the password for tokens or biometrics must satisfy this policy and in some cases prevents the use of this stronger authentication. Also, longer passwords may preclude the use of strict complexity requirements. The password requirements have been changed to allow the entity to specify the most effective password parameters based on the impact of the BES Cyber System, the way passwords are used, and the significance of passwords in restricting access to the system. The SDT believes these changes strengthen the authentication mechanism by requiring entities to look at the most effective use of passwords in their environment. Otherwise, prescribing a strict password policy has the potential to limit the effectiveness of security mechanisms and preclude better mechanisms in the future.~~

Rationale for Requirement R5 (continued):

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the

same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Requirement Part 5.7 assists in preventing online password attacks by limiting the number of guesses an attacker can make. This requirement allows either limiting the number of failed authentication attempts or alerting after a defined number of failed authentication attempts. Entities should take caution in choosing to limit the number of failed authentication attempts for all accounts because this would allow the possibility for a denial of service attack on the BES Cyber System.

R5. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-007-~~5~~6 Table 5 – System Access Controls* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-~~5~~6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Have a method(s) to enforce authentication of interactive user access, where technically feasible.	An example of evidence may include, but is not limited to, documentation describing how access is authenticated.
~~**Reference to prior version:**~~ ~~*CIP-007-4, R5*~~		~~**Change Rationale:** *The requirement to enforce authentication for all user access is included here. The requirement to establish, implement, and document controls is included in this introductory requirement. The requirement to have technical and procedural controls was removed because technical controls suffice when procedural documentation is already required. The phrase "that minimize the risk of unauthorized access" was removed and more appropriately captured in the rationale statement.*~~	

CIP-007-~~5~~6 Table R5 – System Access Control			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Identify and inventory all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s).	An example of evidence may include, but is not limited to, a listing of accounts by account types showing the enabled or generic account types in use for the BES Cyber System.

~~Reference to prior version:~~ ~~CIP-007-4, 6 Table R5.2 and R5.2.3~~ ~~— System Access Control~~	**Change Rationale:** *CIP-007-4 requires entities to minimize and manage the scope and acceptable use of account privileges. The requirement to minimize account privileges has been removed because the implementation of such a policy is difficult to measure at best.*

~~CIP-007-5 Table R5 – System Access Control~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Identify individuals who have authorized access to shared accounts.	An example of evidence may include, but is not limited to, listing of shared accounts and the individuals who have authorized access to each shared account.

~~Reference to prior version:~~ **CIP-007-~~4~~6 Table R5~~.2~~.2 – System Access Control**	**~~Change Rationale:~~** *~~No significant changes. Added "authorized" access to make clear that individuals storing, losing or inappropriately sharing a password is not a violation of this requirement.~~*

~~CIP-007-5 Table R5 — System Access Control~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Change known default passwords, per Cyber Asset capability	Examples of evidence may include, but are not limited to: • Records of a procedure that passwords are changed when new devices are in production; or • Documentation in system manuals or other vendor documents showing default vendor passwords were generated pseudo-randomly and are thereby unique to the device.

~~Reference to prior version:~~ **CIP-007-~~4~~6 Table R5~~.2.1~~ – System Access Control**	**~~Change Rationale:~~** ~~*The requirement for the "removal, disabling or renaming of such accounts where possible" has been removed and incorporated into guidance for acceptable use of account types. This was removed because those actions are not appropriate on all account types. Added the option of having unique default passwords to permit cases where a system may have generated a default password or a hard-coded uniquely generated default password was manufactured with the BES Cyber System.*~~

~~CIP-007-5 Table R5 – System Access Control~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For password-only authentication for interactive user access, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is, at least, the lesser of eight characters or the maximum length supported by the Cyber Asset; and 5.5.2. Minimum password complexity that is the lesser of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Cyber Asset.	Examples of evidence may include, but are not limited to: • System-generated reports or screen-shots of the system-enforced password parameters, including length and complexity; or • Attestations that include a reference to the documented procedures that were followed.

~~Reference to prior version:~~ **CIP-007-~~4~~6 Table R5~~2~~** **– System Access Control**	**Change Rationale:** ~~*CIP-007-4, Requirement R5.3 requires the use of passwords and specifies a specific policy of six characters or more with a combination of alpha-numeric and special characters. The level of detail in these requirements can restrict more effective security measures. The password requirements have been changed to permit the maximum allowed by the device in cases where the password parameters could otherwise not achieve a stricter policy. This change still achieves the requirement objective to minimize the risk of unauthorized disclosure of password credentials while recognizing password parameters alone do not achieve this. The drafting team felt allowing the Responsible Entity the flexibility of applying the strictest password policy allowed by a device outweighed the need to track a relatively minimally effective control through the TFE process.*~~

~~CIP-007-5 Table R5 – System Access Control~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
5.6	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems with External Routable Connectivity and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, for password-only authentication for interactive user access, either technically or procedurally enforce password changes or an obligation to change the password at least once every 15 calendar months.	Examples of evidence may include, but are not limited to: • System-generated reports or screen-shots of the system-enforced periodicity of changing passwords; or • Attestations that include a reference to the documented procedures that were followed.

~~Reference to prior version:~~ **CIP-007-~~4~~6 Table R5~~ 3.3~~ – System Access Control**	**~~Change Rationale:~~** ~~*This was originally Requirement R5.5.3, but moved to add "external routable connectivity" to medium impact in response to comments. This requirement is limited in scope because the risk to performing an online password attack is lessened by its lack of external routable connectivity. Frequently changing passwords at field assets can entail significant effort with minimal risk reduction.~~

~~CIP-007-5 Table R5 – System Access Control~~

Part	Applicable Systems	Requirements	Measures
5.7	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Where technically feasible, either: • Limit the number of unsuccessful authentication attempts; or • Generate alerts after a threshold of unsuccessful authentication attempts.	Examples of evidence may include, but are not limited to: • Documentation of the account-lockout parameters; or • Rules in the alerting configuration showing how the system notified individuals after a determined

	Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; 2. PACS; and 3. PCA		number of unsuccessful login attempts.
~~Reference to prior version:~~ *~~New Requirement~~*		**~~Change Rationale:~~** *~~Minimizing the number of unsuccessful login attempts significantly reduces the risk of live password cracking attempts. This is a more effective control in live password attacks than password parameters.~~*	

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority ~~("~~" (CEA~~") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Requirement R1 exists to reduce the attack surface of Cyber Assets by requiring entities to disable known unnecessary ports. The SDT intends for the entity to know what network accessible ("listening") ports and associated services are accessible on their assets and systems, whether they are needed for that Cyber Asset's function, and disable or restrict access to all other ports.

1.1. This requirement is most often accomplished by disabling the corresponding service or program that is listening on the port or configuration settings within the Cyber Asset. It can also be accomplished through using host-based firewalls, TCP_Wrappers, or other means on the Cyber Asset to restrict access. Note that the requirement is applicable at the Cyber Asset level. The Cyber Assets are those which comprise the applicable BES Cyber Systems and their associated Cyber Assets. This control is another layer in the defense against network-based attacks, therefore the SDT intends that the control be on the device itself, or positioned inline in a non-bypassable manner. Blocking ports at the ESP border does not substitute for this device level requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed 'needed.'

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Physical Security Perimeter in which

case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem, connecting a network cable that bridges networks, or inserting a USB drive. Ports used for 'console commands' primarily means serial ports on Cyber Assets that provide an administrative interface.

The protection of these ports can be accomplished in several ways including, but not limited to:

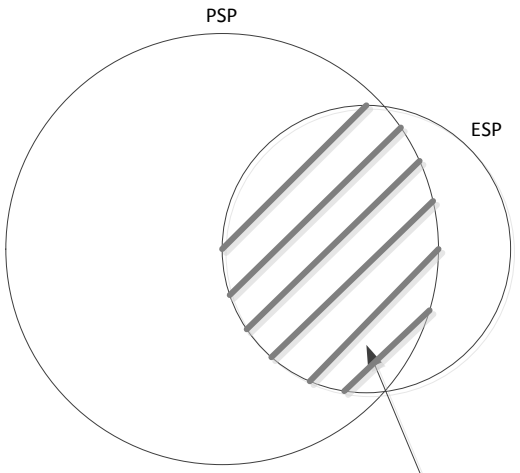
- Disabling all unneeded physical ports within the Cyber Asset's configuration
- Prominent signage, tamper tape, or other means of conveying that the ports should not be used without proper authorization
- Physical port obstruction through removable locks

The network ports included in the scope of this requirement part are not limited to those on the BES Cyber System itself. The scope of physical network ports includes those ports that may exist on nonprogrammable devices such as unmanaged switches, hubs, or patch panels.

This is a 'defense in depth' type control and it is acknowledged that there are other layers of control (the PSP for one) that prevent unauthorized personnel from gaining physical access to these ports. Even with physical access, it has been pointed out there are other ways to circumvent the control. This control, with its inclusion of means such as signage, is not meant to be a preventative control against intruders. Signage is indeed a directive control, not a preventative one. However, with a defense-in-depth posture, different layers and types of controls are required throughout the standard with this providing another layer for depth in Control Center environments. Once physical access has been achieved through the other preventative and detective measures by authorized personnel, a directive control that outlines proper behavior as a last line of defense ~~are~~is appropriate in these highest risk areas. In essence, signage would be used to remind authorized users to "think before you plug anything into one of these systems" which is the intent. This control is not designed primarily for intruders, but for example the authorized employee who intends to plug his possibly infected smartphone into an operator console USB port to charge the battery.

The Applicable Systems column was updated on CIP-007-6 Requirement 1, Part 1.2 to include "Nonprogrammable communication components located inside both a PSP and an ESP." This should be interpreted to apply to only those nonprogrammable communication components that are inside both an ESP and a PSP in combination, not those components that are in only one perimeter as can be illustrated in the following diagram:

Location of Nonprogrammable Communication Components



Applicability of CIP-007-6 R1, Part 1.2 for Nonprogrammable Communication Components

Requirement R2:

The SDT's intent of Requirement R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; the main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. ~~Stand alone~~Standalone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with lower tier documents establishing the more detailed process followed for individual systems. Lower tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. The Responsible Entity is to have a patch management program that covers tracking, evaluating, and installing cyber security patches. The requirement applies to patches only, which are fixes released to handle a specific vulnerability in a hardware or software product. The requirement covers only patches that involve cyber security fixes and does not cover patches that are purely functionality related with no cyber security impact. Tracking involves processes for notification of the availability of new cyber security patches for the Cyber Assets. Documenting the patch source in the tracking portion of the process is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they

can be assessed and applied in order to not jeopardize the availability or integrity of the control system. The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors could all be sources to monitor for release of security related patches, hotfixes, and/or updates. A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. The identification of these sources is intended to be performed once unless software is changed or added to the Cyber Asset's baseline.

2.2. Responsible Entities are to perform an assessment of security related patches within 35 days of release from their monitored source. An assessment should consist of determination of the applicability of each patch to the entity's specific environment and systems. Applicability determination is based primarily on whether the patch applies to a specific software or hardware component that the entity does have installed in an applicable Cyber Asset. A patch that applies to a service or component that is not installed in the entity's environment is not applicable. If the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, the urgency and timeframe of the remediation, and the steps the entity has previously taken or will take. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. It is possible security patches, hotfixes, and updates may reduce the reliability of the system, and entities should take this into account when determining the type of mitigation to apply. The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The requirement handles the situations where it is more of a reliability risk to patch a running system than the vulnerability presents. In all cases, the entity either installs the patch or documents (either through the creation of a new or update of an existing mitigation plan) what they are going to do to mitigate the vulnerability and when they are going to do so. There are times when it is in the best interest of reliability to not install a patch, and the entity can document what they have done to mitigate the vulnerability. For those security related patches that are determined to be applicable, the Responsible Entity must within 35 days either install the patch, create a dated mitigation plan which will outline the actions to be taken or

those that have already been taken by the Responsible Entity to mitigate the vulnerabilities addressed by the security patch, or revise an existing mitigation plan. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration." "Mitigation plans" in the standard refers to internal documents and are not to be confused with plans that are submitted to Regional Entities in response to violations.

2.4. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

3.1. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware as well as the constantly evolving threat and resultant tools and controls, it is not practical within the standard to prescribe how malware is to be addressed on each Cyber Asset. Rather, the Responsible Entity determines on a BES Cyber System basis which Cyber Assets have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional antivirus solutions for common operating systems, white-listing solutions, network isolation techniques, ~~portable storage media policies,~~ Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or Cyber Assets that are of identical architecture, they may provide one process that describes how all the like Cyber Assets are covered. If a specific Cyber Asset has no updateable software and its executing code cannot be altered, then that Cyber Asset is considered to have its own internal method of deterring malicious code.

3.2. When malicious code is detected on a Cyber Asset within the applicability of this requirement, the threat posed by that code must be mitigated. In situations where traditional antivirus products are used, they may be configured to automatically remove or quarantine the malicious code. In white-listing situations, the white-listing tool itself can mitigate the threat as it will not allow the code to execute, however steps should still be taken to remove the malicious code from the Cyber Asset. In some instances, it may be in the best interest of reliability to not immediately remove or quarantine the malicious code, such as when availability of the system may be jeopardized by removal while operating and a rebuild of the system needs to be scheduled. In that case, monitoring may be increased and steps taken to insure the malicious code cannot communicate with other systems. In some instances the entity may be working with law enforcement or other governmental entities to closely monitor the code and track the perpetrator(s). For these reasons, there is no maximum timeframe or

method prescribed for the removal of the malicious code, but the requirement is to mitigate the threat posed by the now identified malicious code.

3.3. In instances where malware detection technologies depend on signatures or patterns of known attacks, the effectiveness of these tools against evolving threats is tied to the ability to keep these signatures and patterns updated in a timely manner. The entity is to have a documented process that includes the testing and installation of signature or pattern updates. In a BES Cyber System, there may be some Cyber Assets that would benefit from the more timely installation of the updates where availability of that Cyber Asset would not jeopardize the availability of the BES Cyber System's ability to perform its function. For example, some HMI workstations where portable media is utilized may benefit from having the very latest updates at all times with minimal testing. Other Cyber Assets should have any updates thoroughly tested before implementation where the result of a 'false positive' could harm the availability of the BES Cyber System. The testing should not negatively impact the reliability of the BES. The testing should be focused on the update itself and if it will have an adverse impact on the BES Cyber System. Testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on ensuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.

Requirement R4:

Refer to NIST 800-92 and 800-137 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in Version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent of the SDT that if a device cannot log a particular event that a TFE must be generated. The SDT's intent is that if any of the items in the bulleted list (for example, user logouts) can be logged by the device then the entity must log that item. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Failure of security event logging mechanisms
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3 Logs that are created under Part 4.1 are to be retained on the applicable Cyber Assets or BES Cyber Systems for at least 90 days. This is different than the evidence retention period called for in the CIP standards used to prove historical compliance. For such audit purposes, the entity should maintain evidence that shows that 90 days were kept historically. One example would be records of disposition of event logs beyond 90 days up to the evidence retention period.

4.4. Reviewing logs at least every 15 days (approximately every two weeks) can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc~~).~~.). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Database.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.
- Generic account: A group account set up by the operating system or application to perform specific operations. This differs from a shared user account in that individual users do not receive authorization for access to this account type.

5.1 Reference the Requirement's rationale.

5.2 Where possible, default and other generic accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default and other generic accounts remaining enabled must be documented. For common configurations, this documentation can be performed at a BES Cyber System or more general level.

5.3 Entities may choose to identify individuals with access to shared accounts through the access authorization and provisioning process, in which case the individual authorization records suffice to meet this Requirement Part. Alternatively, entities may choose to maintain a separate listing for shared accounts. Either form of evidence achieves the end result of maintaining control of shared accounts.

5.4. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Interactive user access does not include read-only information access in which the configuration of the Cyber Asset cannot change (e.g. front panel displays, web-based reports, etc.). For devices that cannot technically or for operational reasons perform authentication, an entity may demonstrate all interactive user access paths, both remote and local, are configured for authentication. Physical security suffices for local access configuration if the physical security can record who is in the Physical Security Perimeter and at what time.

Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or "special" characters (e.g. #, $, @, &), in various combinations.

5.6 Technical or procedural enforcement of password change obligations are required where passwords are the only credential used to authenticate individuals. Technical enforcement of password change obligations means the Cyber Asset requires a password change after a specified timeframe prior to allowing access. In this case, the password is not required to change by the specified time as long as the Cyber Asset enforces the password change after the next successful authentication of the account. Procedural enforcement means manually changing passwords used for interactive user access after a specified timeframe.

5.7 Configuring an account lockout policy or alerting after a certain number of failed authentication attempts serves to prevent unauthorized access through an online password guessing attack. The threshold of failed authentication attempts should be set high enough to avoid false-positives from authorized users failing to authenticate. It should also be set low enough to account for online password attacks occurring over an extended period of time. This threshold may be tailored to the operating environment over time to avoid unnecessary account lockouts.

Entities should take caution when configuring account lockout to avoid locking out accounts necessary for the BES Cyber System to perform a BES reliability task. In such cases, entities should configure authentication failure alerting.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted final ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5.	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-009-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-009-6.

6. Background:

Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-6 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Medium**	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for BES Cyber Systems. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address the conditions for activation in Part 1.1. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address three or more of the requirements in Parts 1.2 through 1.5.

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 15 calendar months, not exceeding 16 calendar months between tests. (2.2) OR The Responsible Entity has not tested	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan. None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

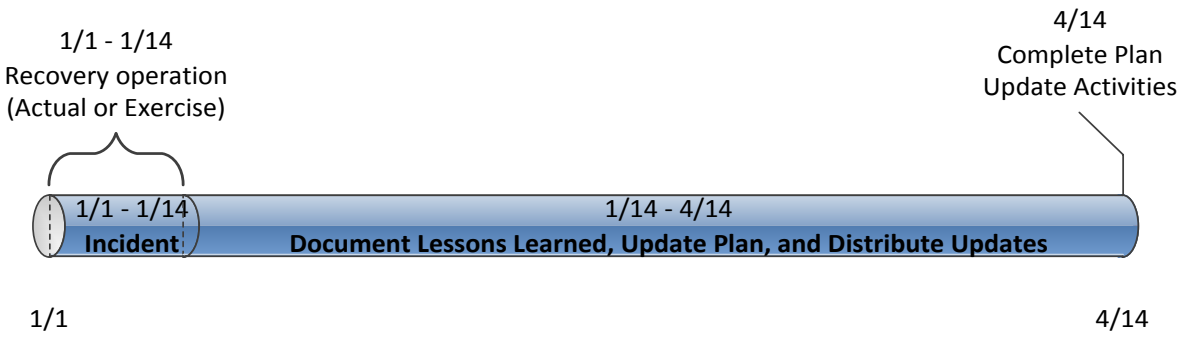

Figure 1: CIP-009-6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

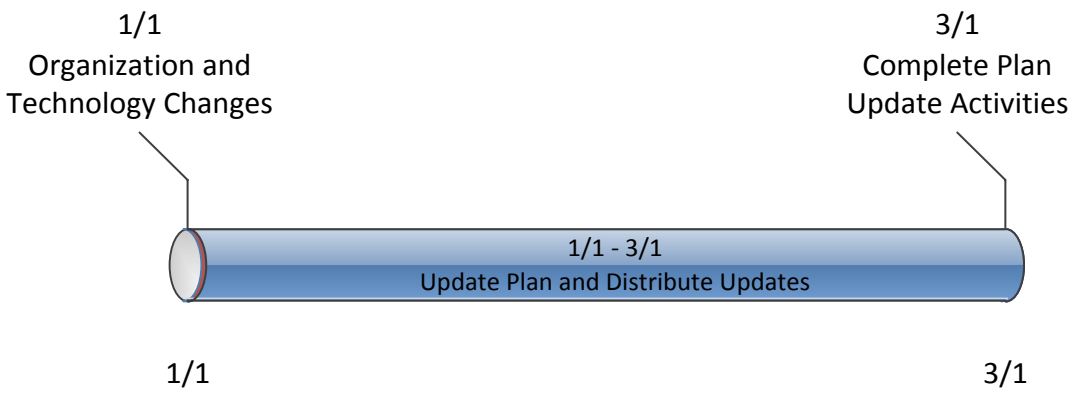

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014
~~3.~~4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted ~~for an additional comment and ballot~~final ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~August 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	
3	3/31/10	Approved by FERC.	
4	1/24/11	Approved by the NERC Board of Trustees.	
5	11/26/12	Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.
5	11/22/13	FERC Order issued approving CIP-009-5.	
~~6~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-009-6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction~~See Implementation Plan for CIP-009-6.

6. Background:

Standard CIP-009 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.

- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery plan(s) that collectively include each of the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-6 Table R1 – Recovery Plan Specifications*.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

CIP-009-6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

Rationale for Requirement R2:

The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.

Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-6~~5~~ Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.

CIP-009-6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

Rationale for Requirement R3:

To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

R3. Each Responsible Entity shall maintain each of its recovery plan(s) in accordance with each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigations

Self-Reporting

Complaints

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power plants~~' facilities~~.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

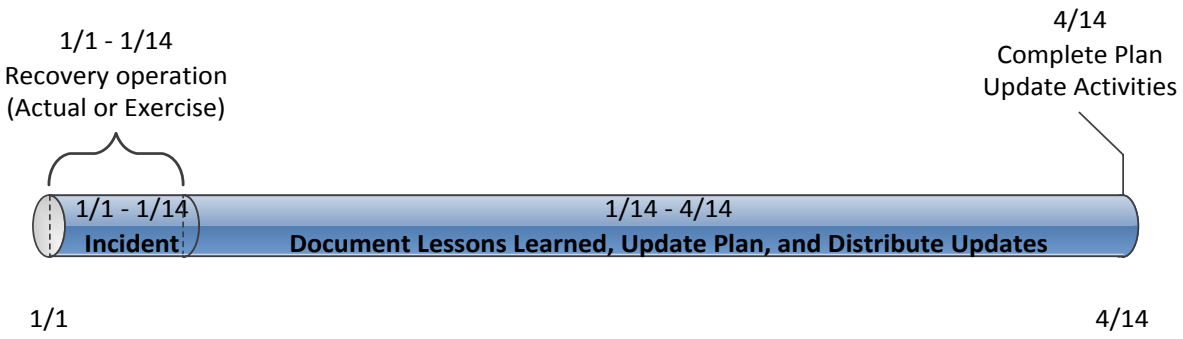

Figure 1: CIP-009-6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

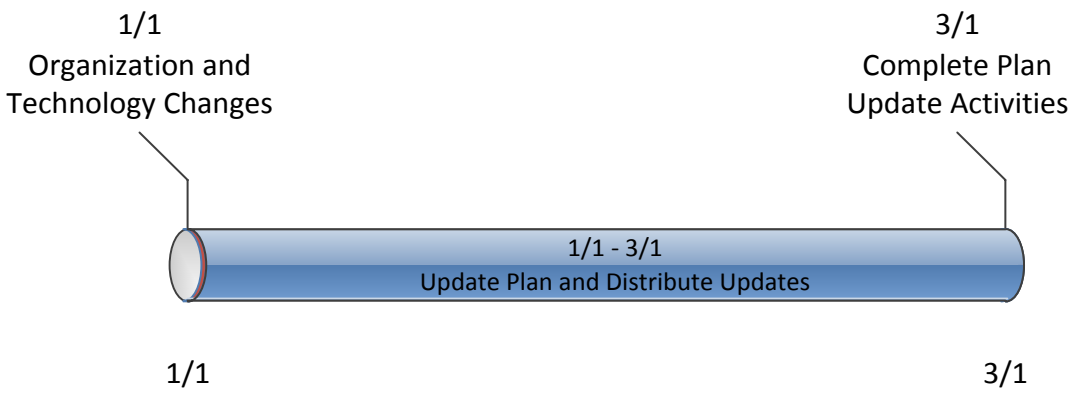

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First Comment and Ballot Period concluded on July 16, 2014
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted final ballot. The draft includes modifications to meet the directives of FERC Order No. 791.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014

~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014
~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

~~Effective Dates~~

1. ~~**24 Months Minimum –** CIP-009-5 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.~~
2. ~~In those jurisdictions where no regulatory approval is required, CIP-009-5 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center~~".~~."	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a ~~Responsible Entity.~~responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated ~~version number~~Version Number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees.	~~Update~~
3	3/31/10	Approved by FERC.	
4	~~12/30/10~~1/24/11	~~Modified to add specific criteria for Critical Asset identification.~~Approved by the NERC Board of Trustees.	~~Update~~
~~4~~5	~~1/24/~~11/26/12	~~Approved~~Adopted by the NERC Board of Trustees.	Modified to coordinate with other CIP standards and to revise format to use RBS Template.

Version	Date	Action	Change Tracking
5	~~TBD~~11/22/13	~~Modified to coordinate with other CIP standards and to revise format to use RBS Template.~~FERC Order issued approving CIP-009-5.	

~~Definitions of Terms Used in the Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Systems

2. Number: CIP-009-~~5~~6

3. Purpose: To recover reliability functions performed by BES Cyber Systems by specifying recovery plan requirements in support of the continued stability, operability, and reliability of the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-009-~~5~~6:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-009-6.

6. Background:

Standard CIP-009 ~~-5~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~].~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~ **~~in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented processes, but they must address the applicable requirements in the table. ~~The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the~~

~~documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

B. Requirements and Measures

~~**Rationale for R1:** Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.~~

~~**Summary of Changes:** Added provisions to protect data that would be useful in the investigation of an event that results in the need for a Cyber System recovery plan to be utilized.~~

Rationale for Requirement R1:

Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is, therefore, necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber System functionality occurs.

R1. Each Responsible Entity shall have one or more documented recovery ~~plans~~plan(s) that collectively include each of the applicable requirement parts in *CIP-009-~~5~~6 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning].*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable requirement parts in *CIP-009-~~5~~6 Table R1 – Recovery Plan Specifications*.

CIP-009-~~5~~6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Conditions for activation of the recovery plan(s).	An example of evidence may include, but is not limited to, one or more plans that include language identifying conditions for activation of the recovery plan(s).
~~**Reference to prior version:**~~ ~~*CIP-009, R1.1*~~		~~**Change Description and Justification:** *Minor wording changes; essentially unchanged.*~~	
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Roles and responsibilities of responders.	An example of evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders.
~~**Reference to prior version:**~~ ~~*CIP-009, R1.2*~~		~~**Change Description and Justification:** *Minor wording changes; essentially unchanged.*~~	

CIP-009-~~5~~6 Table R1 – Recovery Plan Specifications			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	An example of evidence may include, but is not limited to, documentation of specific processes for the backup and storage of information required to recover BES Cyber System functionality.

~~Reference to prior version:~~ **CIP-009~~, R4~~-6 Table R1 – Recovery Plan Specifications**	~~**Change Description and Justification:** *Addresses FERC Order Paragraph 739 and 748. The modified wording was abstracted from Paragraph 744.*~~

~~CIP-009-5 Table R1 – Recovery Plan Specifications~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	One or more processes to verify the successful completion of the backup processes in Part 1.3 and to address any backup failures.	An example of evidence may include, but is not limited to, logs, workflow or other documentation confirming that the backup process completed successfully and backup failures, if any, were addressed.
~~**Reference to prior version:**~~ ~~*New Requirement*~~		~~**Change Description and Justification:** *Addresses FERC Order Section 739 and 748.*~~	
1.5	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	One or more processes to preserve data, per Cyber Asset capability, for determining the cause of a Cyber Security Incident that triggers activation of the recovery plan(s). Data preservation should not impede or restrict recovery.	An example of evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive or making a data mirror of the system before proceeding with recovery.

~~Reference to prior version:~~ ~~*New*~~**Rationale for Requirement R2:** The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans. Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot-sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.	**~~Change Description and Justification:~~** ~~*Added requirement to address FERC Order No. 706, Paragraph 706.*~~

~~**Rationale for R2:**~~

~~The implementation of an effective recovery plan mitigates the risk to the reliable operation of the BES by reducing the time to recover from various hazards affecting BES Cyber Systems. This requirement ensures continued implementation of the response plans.~~

~~Requirement Part 2.2 provides further assurance in the information (e.g. backup tapes, mirrored hot sites, etc.) necessary to recover BES Cyber Systems. A full test is not feasible in most instances due to the amount of recovery information, and the Responsible Entity must determine a sampling that provides assurance in the usability of the information.~~

~~**Summary of Changes.** Added operational testing for recovery of BES Cyber Systems.~~

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ its documented recovery plan(s) to collectively include each of the applicable requirement parts in *CIP-009-~~5~~6 Table R2 – Recovery Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-time Operations.]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable requirement parts in *CIP-009-~~5~~6 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-~~5~~6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test each of the recovery plans referenced in Requirement R1 at least once every 15 calendar months: • By recovering from an actual incident; • With a paper drill or tabletop exercise; or • With an operational exercise.	An example of evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with an operational exercise) of the recovery plan at least once every 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.
~~**Reference to prior version:**~~ ~~*CIP-009, R2*~~		~~**Change Description and Justification:** *Minor wording change; essentially unchanged.*~~	

CIP-009-~~5~~6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	Test a representative sample of information used to recover BES Cyber System functionality at least once every 15 calendar months to ensure that the information is useable and is compatible with current configurations. An actual recovery that incorporates the information used to recover BES Cyber System functionality substitutes for this test.	An example of evidence may include, but is not limited to, operational logs or test results with criteria for testing the usability (e.g. sample tape load, browsing tape contents) and compatibility with current system configurations (e.g. manual or automated comparison checkpoints between backup media contents and current configuration).
~~**Reference to prior version:**~~ ~~*CIP-009, R5*~~		~~**Change Description and Justification:** *Specifies what to test and makes clear the test can be a representative sampling. These changes, along with Requirement Part 1.4 address the FERC Order No. 706, Paragraphs 739 and 748 related to testing of backups by providing high confidence the information will actually recover the system as necessary.*~~	

CIP-009-~~5~~6 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems	Test each of the recovery plans referenced in Requirement R1 at least once every 36 calendar months through an operational exercise of the recovery plans in an environment representative of the production environment. An actual recovery response may substitute for an operational exercise.	Examples of evidence may include, but are not limited to, dated documentation of: • An operational exercise at least once every 36 calendar months between exercises, that demonstrates recovery in a representative environment; or • An actual recovery response that occurred within the 36 calendar month timeframe that exercised the recovery plans.

~~Reference to prior version:~~ *~~CIP-009, R2~~*	**~~Change Description and Justification:~~** *~~Addresses FERC Order No. 706, Paragraph 725 to add the requirement that the recovery plan test be a full operational test once every 3 years.~~* **Rationale for Requirement R3:** To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.

~~**Rationale for R3:** To improve the effectiveness of BES Cyber System recovery plan(s) following a test, and to ensure the maintenance and distribution of the recovery plan(s). Responsible Entities achieve this by (i) performing a lessons learned review in 3.1 and (ii) revising the plan in 3.2 based on specific changes in the organization or technology that would impact plan execution. In both instances when the plan needs to change, the Responsible Entity updates and distributes the plan.~~

~~**Summary of Changes:** Makes clear when to perform lessons learned review of the plan and specifies the timeframe for updating the recovery plan.~~

R3. Each Responsible Entity shall maintain each of its recovery ~~plans~~plan(s) in accordance with each of the applicable requirement parts in *CIP-009-~~5~~6 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment].*

M3. Acceptable evidence includes, but is not limited to, each of the applicable requirement parts in *CIP-009-~~5~~6 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-~~5~~6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 90 calendar days after completion of a recovery plan test or actual recovery: 3.1.1. Document any lessons learned associated with a recovery plan test or actual recovery or document the absence of any lessons learned; 3.1.2. Update the recovery plan based on any documented lessons learned associated with the plan; and 3.1.3. Notify each person or group with a defined role in the recovery plan of the updates to the recovery plan based on any documented lessons learned.	An example of evidence may include, but is not limited to, all of the following: 1. Dated documentation of identified deficiencies or lessons learned for each recovery plan test or actual incident recovery or dated documentation stating there were no lessons learned; 2. Dated and revised recovery plan showing any changes based on the lessons learned; and 3. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.

CIP-009-~~5~~6 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicable Systems**	**Requirements**	**Measures**
~~**Reference to prior version:**~~ ~~*CIP-009, R1 and R3*~~		~~**Change Description and Justification:** *Added the timeframes for performing lessons learned and completing the plan updates. This requirement combines all three activities in one place. Where previous versions specified 30 calendar days for performing lessons learned, followed by additional time for updating recovery plans and notification, this requirement combines those activities into a single timeframe.*~~	
3.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems at Control Centers and their associated: 1. EACMS; and 2. PACS	No later than 60 calendar days after a change to the roles or responsibilities, responders, or technology that the Responsible Entity determines would impact the ability to execute the recovery plan: 3.2.1. Update the recovery plan; and 3.2.2. Notify each person or group with a defined role in the recovery plan of the updates.	An example of evidence may include, but is not limited to, all of the following: 1. Dated and revised recovery plan with changes to the roles or responsibilities, responders, or technology; and 2. Evidence of plan update distribution including, but not limited to: • Emails; • USPS or other mail service; • Electronic distribution system; or • Training sign-in sheets.
~~**Reference to prior version:**~~ ~~*New Requirement*~~		~~**Change Description and Justification:** *Specifies the activities required to maintain the plan. The previous version required entities to update the plan in response to any changes. The modifications make clear the specific changes that would require an update.*~~	

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority ~~("~~" (CEA~~") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance ~~Audit~~Audits

Self-~~Certification~~Certifications

Spot Checking

Compliance ~~Investigation~~Investigations

Self-Reporting

~~• Complaint~~

Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-~~5~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Medium**	N/A	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address one of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has developed recovery plan(s), but the plan(s) do not address two of the requirements included in Parts 1.2 through 1.5.	The Responsible Entity has not created recovery plan(s) for BES Cyber Systems. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address the conditions for activation in Part 1.1. OR The Responsible Entity has created recovery plan(s) for BES Cyber Systems, but the plan(s) does not address three or more of the requirements in Parts 1.2 through 1.5.

R #	Time Horizon	VRF	Violation Severity Levels (CIP-009-~~5~~6)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R2	**Operations Planning** **Real-time Operations**	**Lower**	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months between tests of the plan~~, and when tested, any deficiencies were identified, assessed, and corrected~~. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 15 calendar months, not exceeding 16 calendar months between tests~~, and~~	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar months between tests of the plan~~, and when tested, any deficiencies were identified, assessed, and corrected~~. Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

The following guidelines are available to assist in addressing the required components of a recovery plan:

- NERC, Security Guideline for the Electricity Sector: Continuity of Business Processes and Operations Operational Functions, September 2011, online at http://www.nerc.com/docs/cip/sgwg/Continuity%20of%20Business%20and%20Operational%20Functions%20FINAL%20102511.pdf
- National Institute of Standards and Technology, Contingency Planning Guide for Federal Information Systems, Special Publication 800-34 revision 1, May 2010, online at http://csrc.nist.gov/publications/nistpubs/800-34-rev1/sp800-34-rev1_errata-Nov11-2010.pdf

The term recovery plan is used throughout this Reliability Standard to refer to a documented set of instructions and resources needed to recover reliability functions performed by BES Cyber Systems. The recovery plan may exist as part of a larger business continuity or disaster recovery plan, but the term does not imply any additional obligations associated with those disciplines outside of the Requirements.

A documented recovery plan may not be necessary for each applicable BES Cyber System. For example, the short-term recovery plan for a BES Cyber System in a specific substation may be

managed on a daily basis by advanced power system applications such as state estimation, contingency and remedial action, and outage scheduling. One recovery plan for BES Cyber Systems should suffice for several similar facilities such as those found in substations or power ~~plants' facilities~~plants.

For Part 1.1, the conditions for activation of the recovery plan should consider viable threats to the BES Cyber System such as natural disasters, computing equipment failures, computing environment failures, and Cyber Security Incidents. A business impact analysis for the BES Cyber System may be useful in determining these conditions.

For Part 1.2, entities should identify the individuals required for responding to a recovery operation of the applicable BES Cyber System.

For Part 1.3, entities should consider the following types of information to recover BES Cyber System functionality:

1. Installation files and media;
2. Current backup tapes and any additional documented configuration settings;
3. Documented build or restoration procedures; and
4. Cross site replication storage.

For Part 1.4, the processes to verify the successful completion of backup processes should include checking for: (1) usability of backup media, (2) logs or inspection showing that information from current, production system could be read, and (3) logs or inspection showing that information was written to the backup media. Test restorations are not required for this Requirement Part. The following backup scenarios provide examples of effective processes to verify successful completion and detect any backup failures:

- Periodic (e.g. daily or weekly) backup process – Review generated logs or job status reports and set up notifications for backup failures.
- Non-periodic backup process– If a single backup is provided during the commissioning of the system, then only the initial and periodic (every 15 months) testing must be done. Additional testing should be done as necessary and can be a part of the configuration change management program.
- Data mirroring – Configure alerts on the failure of data transfer for an amount of time specified by the entity (e.g. 15 minutes) in which the information on the mirrored disk may no longer be useful for recovery.
- Manual configuration information – Inspect the information used for recovery prior to storing initially and periodically (every 15 months). Additional inspection should be done as necessary and can be a part of the configuration change management program.

The plan must also include processes to address backup failures. These processes should specify the response to failure notifications or other forms of identification.

For Part 1.5, the recovery plan must include considerations for preservation of data to determine the cause of a Cyber Security Incident. Because it is not always possible to initially

know if a Cyber Security Incident caused the recovery activation, the data preservation procedures should be followed until such point a Cyber Security Incident can be ruled out. CIP-008 addresses the retention of data associated with a Cyber Security Incident.

Requirement R2:

A Responsible Entity must exercise each BES Cyber System recovery plan every 15 months. However, this does not necessarily mean that the entity must test each plan individually. BES Cyber Systems that are numerous and distributed, such as those found at substations, may not require an individual recovery plan and the associated redundant facilities since reengineering and reconstruction may be the generic response to a severe event. Conversely, there is typically one control center per bulk transmission service area that requires a redundant or backup facility. Because of these differences, the recovery plans associated with control centers differ a great deal from those associated with power plants and substations.

A recovery plan test does not necessarily cover all aspects of a recovery plan and failure scenarios, but the test should be sufficient to ensure the plan is up to date and at least one restoration process of the applicable cyber systems is covered.

Entities may use an actual recovery as a substitute for exercising the plan every 15 months. Otherwise, entities must exercise the plan with a paper drill, tabletop exercise, or operational exercise. For more specific types of exercises, refer to the FEMA Homeland Security Exercise and Evaluation Program (HSEEP). It lists the following four types of discussion-based exercises: seminar, workshop, tabletop, and games. In particular, it defines that, "A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. [Table top exercises (TTX)] can be used to assess plans, policies, and procedures."

The HSEEP lists the following three types of operations-based exercises: Drill, functional exercise, and full-scale exercise. It defines that, "[A] full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, Emergency operation centers, etc.) and 'boots on the ground' response (e.g., firefighters decontaminating mock victims)."

For Part 2.2, entities should refer to the backup and storage of information required to recover BES Cyber System functionality in Requirement Part 1.3. This provides additional assurance that the information will actually recover the BES Cyber System as necessary. For most complex computing equipment, a full test of the information is not feasible. Entities should determine the representative sample of information that provides assurance in the processes for Requirement Part 1.3. The test must include steps for ensuring the information is useable and current. For backup media, this can include testing a representative sample to make sure the information can be loaded, and checking the content to make sure the information reflects the current configuration of the applicable Cyber Assets.

Requirement R3:

This requirement ensures entities maintain recovery plans. There are two requirement parts that trigger plan updates: (1) lessons learned and (2) organizational or technology changes.

The documentation of lessons learned is associated with each recovery activation, and it involves the activities as illustrated in Figure 1, below. The deadline to document lessons learned starts after the completion of the recovery operation in recognition that complex recovery activities can take a few days or weeks to complete. The process of conducting lessons learned can involve the recovery team discussing the incident to determine gaps or areas of improvement within the plan. It is possible to have a recovery activation without any documented lessons learned. In such cases, the entity must retain documentation of the absence of any lessons learned associated with the recovery activation.

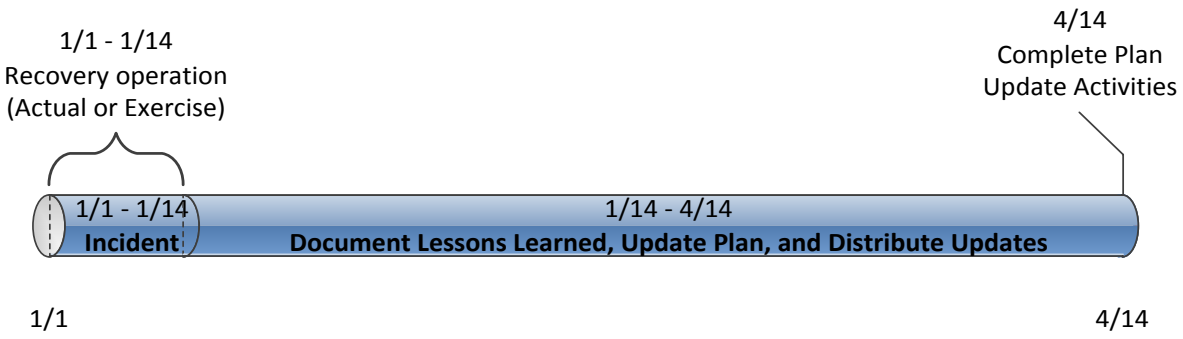

Figure 1: CIP-009-~~5~~6 R3 Timeline

The activities necessary to complete the lessons learned include updating the plan and distributing those updates. Entities should consider meeting with all of the individuals involved in the recovery and documenting the lessons learned as soon after the recovery activation as possible. This allows more time for making effective updates to the plan, obtaining any necessary approvals, and distributing those updates to the recovery team.

The plan change requirement is associated with organization and technology changes referenced in the plan and involves the activities illustrated in Figure 2, below. Organizational changes include changes to the roles and responsibilities people have in the plan or changes to the response groups or individuals. This may include changes to the names or contact information listed in the plan. Technology changes affecting the plan may include referenced information sources, communication systems, or ticketing systems.

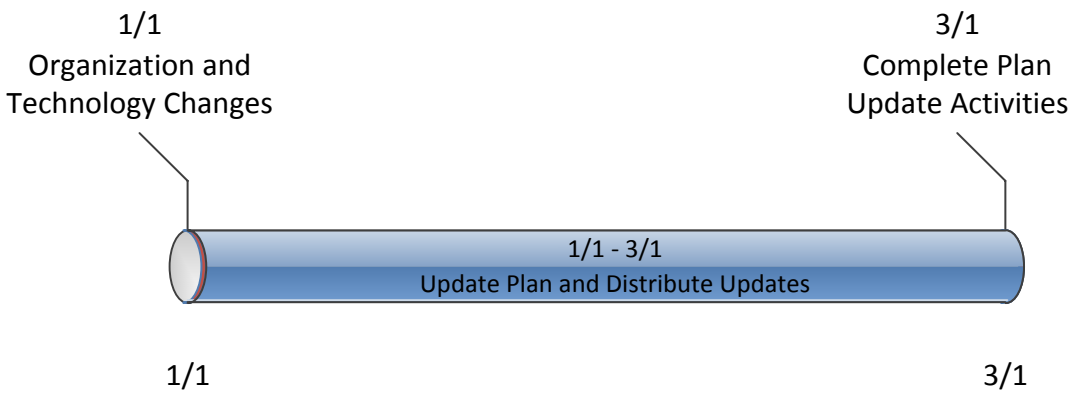

Figure 2: Timeline for Plan Changes in 3.2

When notifying individuals of response plan changes, entities should keep in mind that recovery plans may be considered BES Cyber System Information, and they should take the appropriate measures to prevent unauthorized disclosure of recovery plan information. For example, the recovery plan itself, or other sensitive information about the recovery plan, should be redacted from Email or other unencrypted transmission.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-010-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R1 – Configuration Change Management

Part	Applicable Systems	Requirements	Measures
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaints

d. Additional Compliance Information:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

~~**Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.**~~

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. ~~3.~~ Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~an additional comment and ballot to ballot the removal of "identify, assess, and correct" language~~final ballot. The draft includes modifications to meet the FERC Order No. 791 directive~~s to remove or modify the "identify, assess, and correct" language from CIP-010~~.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~September 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	
~~X~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~X~~2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~X~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-010-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction~~See Implementation Plan for CIP-010-2.

6. Background:

Standard CIP-010 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident

response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~X~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~X~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.

CIP-010-~~X~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.

CIP-010-~~X~~ 2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

Rationale for Requirement R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~X~~ 2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PCA	Monitor at least once every 35 calendar days for changes to the baseline configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	An example of evidence may include, but is not limited to, logs from a system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~X~~ 2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~X~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.

CIP-010-~~X~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.

CIP-010-~~X~~ 2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

c. Compliance Monitoring and Assessment Processes:

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014

~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014
~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

~~Effective Dates~~

1. ~~**24 Months Minimum –** CIP-010-1 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.~~
2. ~~In those jurisdictions where no regulatory approval is required, CIP-010-1 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

Version History

Version	Date	Action	Change Tracking
1	~~TBD~~11/26/12	~~Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.~~Adopted by the NERC Board of Trustees.	Developed to define the configuration change management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-010-1. (Order becomes effective on 2/3/14.)	

~~Definitions of Terms Used in Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Change Management and Vulnerability Assessments

2. Number: CIP-010-~~1~~2

3. Purpose: To prevent and detect unauthorized changes to BES Cyber Systems by specifying configuration change management and vulnerability assessment requirements in support of protecting BES Cyber Systems from compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-010-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-010-2.

6. Background:

Standard CIP-010~~-1~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~].~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements in the table. ~~The~~

~~documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented processes and could be accomplished through other controls or compliance management activities.~~

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk

Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS~~)~~ ~~–~~)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS~~)~~ ~~–~~)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System

~~**Rationale – R1:**~~

~~The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.~~

- .

B. Requirements and Measures

Rationale for Requirement R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	Examples of evidence may include, but are not limited to: • A spreadsheet identifying the required items of the baseline configuration for each Cyber Asset, individually or by group; or • A record in an asset management system that identifies the required items of the baseline configuration for each Cyber Asset, individually or by group.

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
~~Reference to prior version:~~ ~~*New Requirement*~~		**~~Change Rationale:~~** ~~*The baseline configuration requirement was incorporated from the DHS Catalog for Control Systems Security. The baseline requirement is also intended to clarify precisely when a change management process must be invoked and which elements of the configuration must be examined.*~~	
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Authorize and document changes that deviate from the existing baseline configuration.	Examples of evidence may include, but are not limited to: • A change request record and associated electronic authorization (performed by the individual or group with the authority to authorize the change) in a change management system for each change; or • Documentation that the change was performed in accordance with the requirement.
~~Reference to prior version:~~ ~~*CIP-007-3, R9; CIP-003-3, R6*~~		**~~Change Rationale:~~** ~~*The SDT added requirement to explicitly authorize changes. This requirement was previously implied by CIP-003-3, Requirement R6.*~~	

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration, update the baseline configuration as necessary within 30 calendar days of completing the change.	An example of evidence may include, but is not limited to, updated baseline documentation with a date that is within 30 calendar days of the date of the completion of the change.
~~**Reference to prior version:**~~ ~~*CIP-007-3, R9; CIP-005-3, R5*~~		~~**Change Rationale:** *Document maintenance requirement due to a BES Cyber System change is equivalent to the requirements in the previous versions of the standard.*~~	

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	For a change that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls in CIP-005 and CIP-007 that could be impacted by the change; 1.4.2. Following the change, verify that required cyber security controls determined in 1.4.1 are not adversely affected; and 1.4.3. Document the results of the verification.	An example of evidence may include, but is not limited to, a list of cyber security controls verified or tested along with the dated test results.
~~**Reference to prior version:**~~ ~~*CIP-007-3, R1*~~		~~**Change Rationale:** *The SDT attempted to provide clarity on when testing must occur and removed requirement for specific test procedures because it is implicit in the performance of the requirement.*~~	

CIP-010-~~1~~2 Table R1 – Configuration Change Management			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.5	High Impact BES Cyber Systems	Where technically feasible, for each change that deviates from the existing baseline configuration: 1.5.1. Prior to implementing any change in the production environment, test the changes in a test environment or test the changes in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration to ensure that required cyber security controls in CIP-005 and CIP-007 are not adversely affected; and 1.5.2. Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a list of cyber security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.

~~**Reference to prior version:**~~ ~~*CIP-007-3, R1*~~	~~**Change Rationale:** *This requirement provides clarity on when testing must occur and requires additional testing to ensure that accidental consequences of planned changes are appropriately managed.*~~ ~~*This change addresses FERC Order No. 706, Paragraphs 397, 609, 610, and 611.*~~**Rationale for Requirement R2:** The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

~~**Rationale – R2:**~~

~~The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.~~

R2. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R2 – Configuration Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated:	Monitor at least once every 35 calendar days for changes to the baseline	An example of evidence may include, but is not limited to, logs from a

CIP-010-~~1~~2 Table R2 – Configuration Monitoring			
Part	**Applicable Systems**	**Requirements**	**Measures**
	1. EACMS; and 2. PCA	configuration (as described in Requirement R1, Part 1.1). Document and investigate detected unauthorized changes.	system that is monitoring the configuration along with records of investigation for any unauthorized changes that were detected.
~~**Reference to prior version:**~~ ~~*New Requirement*~~		~~**Change Rationale:** *The monitoring of the configuration of the BES Cyber System provides an express acknowledgement of the need to consider malicious actions along with intentional changes.*~~ ~~*This requirement was added after review of the DHS Catalog of Control System Security and to address FERC Order No. 706, Paragraph 397.*~~ ~~*Thirty-five Calendar days allows for a "once-a-month" frequency with slight flexibility to account for months with 31 days or for beginning or endings of months on weekends.*~~	

~~**Rationale – R3:**~~

~~The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.~~

~~The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.~~

Rationale for Requirement R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of cyber security controls as well as to continually improve the security posture of BES Cyber Systems.

The vulnerability assessment performed for this requirement may be a component of deficiency identification, assessment, and correction.

R3. Each Responsible Entity shall implement one or more documented ~~processes~~process(es) that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning and Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-010-~~1~~2 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-~~1~~2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	At least once every 15 calendar months, conduct a paper or active vulnerability assessment.	Examples of evidence may include, but are not limited to: • A document listing the date of the assessment (performed at least once every 15 calendar months), the controls assessed for each BES Cyber System along with the method of assessment,; or • A document listing the date of the assessment and the output of any tools used to perform the assessment.
~~**Reference to prior version:**~~ ~~*CIP-005-4, R4; CIP-007-4, R8*~~		~~**Change Rationale:** *As suggested in FERC Order No. 706, Paragraph 644, the details for what should be included in the assessment are left to guidance.*~~	

CIP-010-~~1~~2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Where technically feasible, at least once every 36 calendar months: 3.2.1 Perform an active vulnerability assessment in a test environment, or perform an active vulnerability assessment in a production environment where the test is performed in a manner that minimizes adverse effects, that models the baseline configuration of the BES Cyber System in a production environment; and 3.2.2 Document the results of the testing and, if a test environment was used, the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed at least once every 36 calendar months), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.
~~**Reference to prior version:**~~ ~~*New Requirement*~~		~~**Change Rationale:**~~ ~~*FERC Order No. 706, Paragraphs 541, 542, 543, 544, 545, and 547.*~~ ~~*As suggested in FERC Order No. 706, Paragraph 644, the details for what should be included in the assessment are left to guidance.*~~	

CIP-010-~~1~~2 Table R3 – Vulnerability Assessments			
Part	**Applicable Systems**	**Requirements**	**Measures**
3.3	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PCA	Prior to adding a new applicable Cyber Asset to a production environment, perform an active vulnerability assessment of the new Cyber Asset, except for CIP Exceptional Circumstances and like replacements of the same type of Cyber Asset with a baseline configuration that models an existing baseline configuration of the previous or other existing Cyber Asset.	An example of evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new Cyber Asset) and the output of any tools used to perform the assessment.
~~**Reference to prior version:**~~ ~~*New Requirement*~~		~~**Change Rationale:**~~ ~~*FERC Order No. 706, Paragraphs 541, 542, 543, 544, 545, and 547.*~~	
3.4	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Document the results of the assessments conducted according to Parts 3.1, 3.2, and 3.3 and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of any remediation or mitigation action items.	An example of evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items, documented proposed dates of completion for the action plan, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).

~~**Reference to prior version:**~~ ~~*CIP-005-3, R4.5; CIP-007-3, R8.4*~~	~~**Change Rationale:**~~ ~~*Added a requirement for an entity planned date of completion as per the directive in FERC Order No. 706, Paragraph 643.*~~

C. Compliance

1. Compliance Monitoring Process:

a. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority ~~(""~~ (CEA~~") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

b. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Baseline Configuration

The concept of establishing a Cyber Asset's baseline configuration is meant to provide clarity on requirement language found in previous CIP standard versions. Modification of any item within an applicable Cyber Asset's baseline configuration provides the triggering mechanism for when entities must apply change management processes.

Baseline configurations in CIP-010 consist of five different items: Operating system/firmware, commercially available software or open-source application software, custom software, logical network accessible port identification, and security patches. Operating system information identifies the software and version that is in use on the Cyber Asset. In cases where an independent operating system does not exist (such as for a protective relay), then firmware information should be identified. Commercially available or open-source application software identifies applications that were intentionally installed on the cyber asset. The use of the term "intentional" was meant to ensure that only software applications that were determined to be necessary for Cyber Asset use should be included in the baseline configuration. The SDT does not intend for notepad, calculator, DLL, device drivers, or other applications included in an operating system package as commercially available or open-source application software to be

included. Custom software installed may include scripts developed for local entity functions or other custom software developed for a specific task or function for the entity's use. If additional software was intentionally installed and is not commercially available or open-source, then this software could be considered custom software. If a specific device needs to communicate with another device outside the network, communications need to be limited to only the devices that need to communicate per the requirement in CIP-007-~~5~~6. Those ports which are accessible need to be included in the baseline. Security patches applied would include all historical and current patches that have been applied on the cyber asset. While CIP-007-~~5~~6 Requirement R2, Part 2.1 requires entities to track, evaluate, and install security patches, CIP-010 ~~R1~~Requirement R1, Part 1.1.5 requires entities to list all applied historical and current patches.

Further guidance can be understood with the following example that details the baseline configuration for a serial-only microprocessor relay:

Asset #051028 at Substation Alpha

- R1.1.1 – Firmware: [MANUFACTURER]-[MODEL]-XYZ-1234567890-ABC
- R1.1.2 – Not Applicable
- R1.1.3 – Not Applicable
- R1.1.4 – Not Applicable
- R1.1.5 – Patch 12345, Patch 67890, Patch 34567, Patch 437823

Also, for a typical IT system, the baseline configuration could reference an IT standard that includes configuration details. An entity would be expected to provide that IT standard as part of their compliance evidence.

Cyber Security Controls

The use of cyber security controls refers specifically to controls referenced and applied according to CIP-005 and CIP-007. The concept presented in the relevant requirement sub-parts in CIP-010 R1 is that an entity is to identify/verify controls from CIP-005 and CIP-007 that could be impacted for a change that deviates from the existing baseline configuration. The SDT does not intend for Responsible Entities to identify/verify all controls located within CIP-005 and CIP-007 for each change. The Responsible Entity is only to identify/verify those control(s) that could be affected by the baseline configuration change. For example, changes that affect logical network ports would only involve CIP-007 R1 (Ports and Services), while changes that affect security patches would only involve CIP-007 R2 (Security Patch Management). The SDT chose not to identify the specific requirements from CIP-005 and CIP-007 in CIP-010 language as the intent of the related requirements is to be able to identify/verify any of the controls in those standards that are affected as a result of a change to the baseline configuration. The SDT

believes it possible that all requirements from CIP-005 and CIP-007 may be identified for a major change to the baseline configuration, and therefore, CIP-005 and CIP-007 was cited at the standard-level versus the requirement-level.

Test Environment

The Control Center test environment (or production environment where the test is performed in a manner that minimizes adverse effects) should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, security patches, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple components.

Additionally, the Responsible Entity should note that wherever a test environment (or production environment where the test is performed in a manner that minimizes adverse effects) is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a BES Cyber System at a Control Center to be modeled that may not otherwise be able to be replicated or duplicated exactly; such as, but not limited to, a legacy map-board controller or the numerous data communication links from the field or to other Control Centers (such as by ICCP).

Requirement R2:

The SDT's intent of R2 is to require automated monitoring of the BES Cyber System. However, the SDT understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). For that reason, automated technical monitoring was not explicitly required, and a Responsible Entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should note that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well-documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking. In developing their vulnerability assessment processes, Responsible Entities are strongly encouraged to include at least the following elements, several of which are referenced in CIP-005 and CIP-007:

Paper Vulnerability Assessment:

1. Network Discovery - A review of network connectivity to identify all Electronic Access Points to the Electronic Security Perimeter.

2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification.
3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings.
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications.

Active Vulnerability Assessment:

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. **Facilities:** For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 **Distribution Provider**: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 **Responsible Entities listed in 4.1 other than Distribution Providers**:

All BES Facilities.

4.2.3 **Exemptions:** The following are exempt from Standard CIP-011-2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-011-2.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training

program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.

- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity

must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

~~**Note: The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X standards were redlined to the industry-approved version 5 language for ease of reading revisions.**~~

Development Steps Completed

1. SAR posted for comment on January 15, 2014
2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. ~~3.~~ Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

This draft standard is being posted for ~~an additional comment and ballot to ballot the removal of "identify, assess, and correct" language~~final ballot. The draft includes modifications to meet the FERC Order No. 791 directives~~ to remove or modify the "identify, assess, and correct" language from CIP-011~~.

Anticipated Actions	Anticipated Date
~~Additional 45-Day Comment Period~~	~~September 2014~~
Final Ballot is Conducted	October~~/November~~ 2014
Board of Trustees (Board) Adoption	November 2014
Filing to Applicable Regulatory Authorities	December 2014

Version History

Version	Date	Action	Change Tracking
1	11/26/12	Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	
~~X~~	~~June 2014~~	~~Responding to FERC Order No. 791.~~	~~Revised~~

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~X~~2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~X~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

~~Reliability Standard CIP-011-X shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction~~See Implementation Plan for CIP-011-2.

6. Background:

Standard CIP-011 exists as part of a suite of CIP Standards related to cyber security, which require the initial identification and categorization of BES Cyber Systems and require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems.

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in its documented processes, but it must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the

standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:
Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples

may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.

- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA)** – Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System.

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~X~~ 2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~X~~ 2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~X~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~X~~ 2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

Rationale for Requirement R2:

The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented process(es) that collectively include the applicable requirement parts in *CIP-011-~~X~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~X~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~X~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

CIP-011-~~X~~ 2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~X~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2.

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity

must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment ~~(March 20, 2008).~~on January 15, 2014

~~2. SC authorized moving the SAR forward to standard development (July 10, 2008).~~

~~3. First posting for 60-day formal comment period and concurrent ballot (November 2011).~~

~~4. Second posting for 40-day formal comment period and concurrent ballot (April 2012).~~

~~5. Third posting for 30-day formal comment period and concurrent ballot (September 2012).~~

2. Standard Drafting Team appointed on January 29, 2014
3. First 45-Day Comment and Ballot Period concluded on July 16, 2014 with all revisions addressing FERC No. 791 directives
4. Additional 45-Day Comment Period and Ballot concluded on October 17, 2014

Description of Current Draft

~~This is the fourth posting of Version 5 of the CIP Cyber Security Standards for a 10-day recirculation ballot. An initial concept paper, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. A first posting of Version 5, which reverted to the original organization of the standards with some changes, was posted in November 2011 for a 60-day comment period and ballot. A second posting of Version 5 was posted in April 2012 for a 40-day comment period and ballot. A third posting of Version 5 was posted in September 2012 for a 30-day comment period and ballot. Version 5 addresses the balance of the FERC directives in its Order No. 706 approving Version 1 of the standards. This posting for recirculation ballot addresses the comments received from the third posting and ballot.~~

This draft standard is being posted for final ballot. The draft includes modifications to meet the FERC Order No. 791 directives.

Anticipated Actions	Anticipated Date
Final Ballot is Conducted	October 2014
~~Recirculation ballot~~Board of Trustees (Board) Adoption	November ~~2012~~2014

~~BOT adoption~~Filing to Applicable Regulatory Authorities	December ~~2012~~2014

~~Effective Dates~~

1. ~~**24 Months Minimum –** CIP-011-1 shall become effective on the later of July 1, 2015, or the first calendar day of the ninth calendar quarter after the effective date of the order providing applicable regulatory approval.~~
2. ~~In those jurisdictions where no regulatory approval is required, CIP-011-1 shall become effective on the first day of the ninth calendar quarter following Board of Trustees' approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~

Version History

Version	Date	Action	Change Tracking
1	~~TBD~~11/26/12	~~Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.~~Adopted by the NERC Board of Trustees.	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706.
1	11/22/13	FERC Order issued approving CIP-011-1. (Order becomes effective on 2/3/14.)	

~~Definitions of Terms Used in Standard~~

~~*See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.*~~

When this standard has received ballot approval, the text boxes will be moved to the ~~"~~Application Guidelines ~~and Technical Basis" section~~Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-~~1~~2

3. Purpose: To prevent unauthorized access to BES Cyber System Information by specifying information protection requirements in support of protecting BES Cyber Systems against compromise that could lead to misoperation or instability in the BES.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of functional entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific functional entity or subset of functional entities are the applicable entity or entities, the functional entity or entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns one or more of the following Facilities, systems, and equipment for the protection or restoration of the BES:

4.1.2.1 Each underfrequency Load shedding (UFLS) or undervoltage Load shedding (UVLS) system that:

4.1.2.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.1.2.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.1.2.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.1.2.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator or Interchange Authority

4.1.6 Reliability Coordinator

4.1.7 Transmission Operator

4.1.8 Transmission Owner

4.2. Facilities: For the purpose of the requirements contained herein, the following Facilities, systems, and equipment owned by each Responsible Entity in 4.1 above are those to which these requirements are applicable. For requirements in this standard where a specific type of Facilities, system, or equipment or subset of Facilities, systems, and equipment are applicable, these are specified explicitly.

4.2.1 Distribution Provider: One or more of the following Facilities, systems and equipment owned by the Distribution Provider for the protection or restoration of the BES:

4.2.1.1 Each UFLS or UVLS System that:

4.2.1.1.1 is part of a Load shedding program that is subject to one or more requirements in a NERC or Regional Reliability Standard; and

4.2.1.1.2 performs automatic Load shedding under a common control system owned by the Responsible Entity, without human operator initiation, of 300 MW or more.

4.2.1.2 Each Special Protection System or Remedial Action Scheme where the Special Protection System or Remedial Action Scheme is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.3 Each Protection System (excluding UFLS and UVLS) that applies to Transmission where the Protection System is subject to one or more requirements in a NERC or Regional Reliability Standard.

4.2.1.4 Each Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

4.2.2 Responsible Entities listed in 4.1 other than Distribution Providers:

All BES Facilities.

4.2.3 Exemptions: The following are exempt from Standard CIP-011-~~1~~2:

4.2.3.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.3.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3.3 The systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F.R. Section 73.54.

4.2.3.4 For Distribution Providers, the systems and equipment that are not included in section 4.2.1 above.

4.2.3.5 Responsible Entities that identify that they have no BES Cyber Systems categorized as high impact or medium impact according to the CIP-002-5.1 identification and categorization processes.

5. Effective Dates:

See Implementation Plan for CIP-011-2.

6. Background:

Standard CIP-011~~-1~~ exists as part of a suite of CIP Standards related to cyber security~~. CIP-002-5 requires~~, which require the initial identification and categorization of BES Cyber Systems~~. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1,~~ and ~~CIP-011-1~~ require a minimum level of organizational, operational, and procedural controls to mitigate risk to BES Cyber Systems. ~~This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.~~

Most requirements open with, "*Each Responsible Entity shall implement one or more documented [processes, plan, etc~~.~~.] that include the applicable items in [Table Reference].*" The referenced table requires the applicable items in the procedures for the requirement's common subject matter.

~~The SDT has incorporated within this standard a recognition that certain requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:~~

> ~~Each Responsible Entity shall implement~~**~~, in a manner that identifies, assesses, and corrects deficiencies,~~** ~~. . .~~

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in ~~their~~its documented processes, but ~~they~~it must address the applicable requirements in the table~~. The documented processes themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the~~

~~documented processes and could be accomplished through other controls or compliance management activities~~.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e., incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the standards.

Responsible Entities can implement common controls that meet requirements for multiple high and medium impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of applicable items in the documented processes. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an all-inclusive list.

Throughout the standards, unless otherwise stated, bulleted items in the requirements and measures are items that are linked with an "or," and numbered items are items that are linked with an "and."

Many references in the Applicability section use a threshold of 300 MW for UFLS and UVLS. This particular threshold of 300 MW for UVLS and UFLS was provided in Version 1 of the CIP Cyber Security Standards. The threshold remains at 300 MW since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System. A review of UFLS tolerances defined within regional reliability standards for UFLS program requirements to date indicates that the historical value of 300 MW represents an adequate and reasonable threshold value for allowable UFLS operational tolerances.

"Applicable Systems" Columns in Tables:

Each table has an "Applicable Systems" column to further define the scope of systems to which a specific requirement row applies. The CSO706 SDT adapted this concept from the National Institute of Standards and Technology ("NIST") Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the "Applicable Systems" column as described.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as high impact according to the CIP-002-5.1 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as medium impact according to the CIP-002-5.1 identification and categorization processes.
- **Electronic Access Control or Monitoring Systems (EACMS)** – Applies to each Electronic Access Control or Monitoring System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System. Examples may include, but are not limited to, firewalls, authentication servers, and log monitoring and alerting systems.
- **Physical Access Control Systems (PACS)** – Applies to each Physical Access Control System associated with a referenced high impact BES Cyber System or medium impact BES Cyber System with External Routable Connectivity.
- **Protected Cyber Assets (PCA~~)~~) –** Applies to each Protected Cyber Asset associated with a referenced high impact BES Cyber System or medium impact BES Cyber System

- .

~~Rationale – R1:~~

~~The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.~~

~~Summary of Changes: CIP-003-4 R4, R4.2, and R 4.3 have been moved to CIP-011 R1.~~
~~CIP-003-4, Requirement R4.1 was moved to the definition of BES Cyber System~~

B. Requirements and Measures

Rationale for Requirement R1:

The SDT's intent of the information protection program is to prevent unauthorized access to BES Cyber System Information.

R1. Each Responsible Entity shall implement~~, in a manner that identifies, assesses, and corrects deficiencies,~~ one or more documented information protection program(s) that collectively includes each of the applicable requirement parts in *CIP-011-~~1~~2 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning].*

M1. Evidence for the information protection program must include the applicable requirement parts in *CIP-011-~~1~~2 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Method(s) to identify information that meets the definition of BES Cyber System Information.	Examples of acceptable evidence include, but are not limited to: • Documented method to identify BES Cyber System Information from entity's information protection program; or • Indications on information (e.g., labels or classification) that identify BES Cyber System Information as designated in the entity's information protection program; or • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber System Information; or • Repository or electronic and physical location designated for housing BES Cyber System Information in the entity's information protection program.

CIP-011-~~1~~2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirements**	**Measures**
~~**Reference to prior version:**~~ ~~*CIP-003-3, R4; CIP-003-3, R4.2*~~		~~**Change Rationale:** *The SDT removed the explicit requirement for classification as there was no requirement to have multiple levels of protection (*~~e.g., confidential, public, internal use only, etc.~~*) This modification does not prevent having multiple levels of classification, allowing more flexibility for entities to incorporate the CIP information protection program into their normal business.*~~	

CIP-011-~~1~~2 Table R1 – Information Protection			
Part	**Applicable Systems**	**Requirement**	**Measure**
1.2	High Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS Medium Impact BES Cyber Systems and their associated: 1. EACMS; and 2. PACS	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	Examples of acceptable evidence include, but are not limited to: • Procedures for protecting and securely handling, which include topics such as storage, security during transit, and use of BES Cyber System Information; or • Records indicating that BES Cyber System Information is handled in a manner consistent with the entity's documented procedure(s).

~~**Reference to prior version:**~~ ~~*CIP-003-3, R4;*~~	~~**Change** **Rationale:**~~ **for Requirement R2:** The ~~*SDT changed*~~intent of the ~~*language from "protect" information to "Procedures for protecting*~~BES Cyber Asset reuse and ~~*securely handling"*~~disposal process is to ~~*clarify*~~prevent the ~~*protection that is required*~~unauthorized dissemination of BES Cyber System Information upon reuse or disposal.

~~**Rationale – R2:**~~

~~The intent of the BES Cyber Asset reuse and disposal process is to prevent the unauthorized dissemination of BES Cyber System Information upon reuse or disposal.~~

R2. Each Responsible Entity shall implement one or more documented ~~processes~~process(es) that collectively include the applicable requirement parts in *CIP-011-~~1~~2 Table R2 – BES Cyber Asset Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning].*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable requirement parts in *CIP-011-~~1~~2 Table R2 – BES Cyber Asset Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-~~1~~2 Table R2 – BES Cyber Asset Reuse and Disposal			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the release for reuse of applicable Cyber Assets that contain BES Cyber System Information (except for reuse within other systems identified in the "Applicable Systems" column), the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media.	Examples of acceptable evidence include, but are not limited to: • Records tracking sanitization actions taken to prevent unauthorized retrieval of BES Cyber System Information such as clearing, purging, or destroying; or • Records tracking actions such as encrypting, retaining in the Physical Security Perimeter or other methods used to prevent unauthorized retrieval of BES Cyber System Information.

~~**Reference to prior version:**~~ ~~*CIP-007-3, R7.2*~~CIP-011-2 Table R2 – BES Cyber Asset Reuse and Disposal	~~**Change Rationale:** *Consistent with FERC Order No. 706, Paragraph 631, the SDT clarified that the goal was to prevent the unauthorized retrieval of information from the media, removing the word "erase" since, depending on the media itself, erasure may not be sufficient to meet this goal.*~~

~~CIP-011-1 Table R2 — BES Cyber Asset Reuse and Disposal~~			
Part	**Applicable Systems**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA Medium Impact BES Cyber Systems and their associated: 1. EACMS; 2. PACS; and 3. PCA	Prior to the disposal of applicable Cyber Assets that contain BES Cyber System Information, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset or destroy the data storage media.	Examples of acceptable evidence include, but are not limited to: • Records that indicate that data storage media was destroyed prior to the disposal of an applicable Cyber Asset; or • Records of actions taken to prevent unauthorized retrieval of BES Cyber System Information prior to the disposal of an applicable Cyber Asset.
~~**Reference to prior version:**~~ ~~*CIP-007-3, R7.1*~~		~~**Change Rationale:** *Consistent with FERC Order No. 706, Paragraph 631, the SDT clarified that the goal was to prevent the unauthorized retrieval of information from the media, removing the word "erase" since, depending on the media itself, erasure may not be sufficient to meet this goal.*~~ ~~*The SDT also removed the requirement explicitly requiring records of destruction/redeployment as this was seen as demonstration of the existing requirement and not a requirement in and of itself.*~~	

C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority ~~("~~" (CEA~~") unless~~) means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the ~~Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA~~NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- Each Responsible Entity shall retain evidence of each requirement in this standard for three calendar years.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.
- The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance ~~Audit~~Audits
- Self-~~Certification~~Certifications
- Spot Checking
- Compliance ~~Investigation~~Violation Investigations
- Self-Reporting
- ~~Complaint~~
- Complaints

1.4. Additional Compliance Information:

None

2. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	N/A	N/A	N/A ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more methods to identify BES Cyber System Information but did not identify,~~	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					~~assess, or correct the deficiencies. (1.1)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more procedures for protection and secure handling BES Cyber System Information and has identified deficiencies but did not assess or correct the deficiencies. (1.2)~~ ~~OR~~ ~~The Responsible Entity has implemented a BES Cyber System Information protection program which includes one or more procedures for protection and secure handling BES Cyber System Information~~	

R #	Time Horizon	VRF	Violation Severity Levels (CIP-011-~~1~~2)			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					~~but did not identify, assess, or correct the deficiencies. (1.2)~~	
R2	**Operations Planning**	**Lower**	N/A	The Responsible Entity implemented one or more documented processes but did not include processes for reuse as to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.1)	The Responsible Entity implemented one or more documented processes but did not include disposal or media destruction processes to prevent the unauthorized retrieval of BES Cyber System Information from the BES Cyber Asset. (2.2)	The Responsible Entity has not documented or implemented any processes for applicable requirement parts in CIP-011-~~1~~2 Table R2 – BES Cyber Asset Reuse and Disposal. (R2)

Guidelines and Technical Basis

Section 4 – Scope of Applicability of the CIP Cyber Security Standards

Section "4. Applicability" of the standards provides important information for Responsible Entities to determine the scope of the applicability of the CIP Cyber Security Requirements.

Section "4.1. Functional Entities" is a list of NERC functional entities to which the standard applies. If the entity is registered as one or more of the functional entities listed in Section 4.1, then the NERC CIP Cyber Security Standards apply. Note that there is a qualification in Section 4.1 that restricts the applicability in the case of Distribution Providers to only those that own certain types of systems and equipment listed in 4.2. ~~Furthermore,~~

Section "4.2. Facilities" defines the scope of the Facilities, systems, and equipment owned by the Responsible Entity, as qualified in Section 4.1, that is subject to the requirements of the standard. As specified in the exemption section 4.2.3.5, this standard does not apply to Responsible Entities that do not have High Impact or Medium Impact BES Cyber Systems under CIP-002-~~5's~~5.1's categorization. In addition to the set of BES Facilities, Control Centers, and other systems and equipment, the list includes the set of systems and equipment owned by Distribution Providers. While the NERC Glossary term "Facilities" already includes the BES characteristic, the additional use of the term BES here is meant to reinforce the scope of applicability of these Facilities where it is used, especially in this applicability scoping section. This in effect sets the scope of Facilities, systems, and equipment that is subject to the standards.

Requirement R1:

Responsible Entities are free to utilize existing change management and asset management systems. However, the information contained within those systems must be evaluated, as the information protection requirements still apply.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

This requirement mandates that BES Cyber System Information be identified. The Responsible Entity has flexibility in determining how to implement the requirement. The Responsible Entity should explain the method for identifying the BES Cyber System Information in their information protection program. For example, the Responsible Entity may decide to mark or label the documents. Identifying separate classifications of BES Cyber System Information is not specifically required. However, a Responsible Entity maintains the flexibility to do so if they desire. As long as the Responsible Entity's information protection program includes all applicable items, additional classification levels (e.g., confidential, public, internal use only, etc.) can be created that go above and beyond the requirements. If the entity chooses to use classifications, then the types of classifications used by the entity and any associated labeling should be documented in the entity's BES Cyber System Information Program.

The Responsible Entity may store all of the information about BES Cyber Systems in a separate repository or location (physical and/or electronic) with access control implemented. For example, the Responsible Entity's program could document that all information stored in an identified repository is considered BES Cyber System Information, the program may state that all information contained in an identified section of a specific repository is considered BES Cyber System Information, or the program may document that all hard copies of information are stored in a secured area of the building. Additional methods for implementing the requirement are suggested in the measures section. However, the methods listed in measures are not meant to be an exhaustive list of methods that the entity may choose to utilize for the identification of BES Cyber System Information.

The SDT does not intend that this requirement cover publicly available information, such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. R1.2 requires one or more procedures for the protection and secure handling BES Cyber System Information, including storage, transit, and use.

The entity's written Information Protection Program should explain how the entity handles aspects of information protection including specifying how BES Cyber System Information is to be securely handled during transit in order to protect against unauthorized access, misuse, or corruption and to protect confidentiality of the communicated BES Cyber System Information. For example, the use of a third-party communication service provider instead of organization-owned infrastructure may warrant the use of encryption to prevent unauthorized disclosure of information during transmission. The entity may choose to establish a trusted communications path for transit of BES Cyber System Information. The trusted communications path would utilize a logon or other security measures to provide secure handling during transit. The entity may employ alternative physical protective measures, such as the use of a courier or locked container for transmission of information. It is not the intent of this standard to mandate the use of one particular format for secure handling during transit.

A good Information Protection Program will document the circumstances under which BES Cyber System Information can be shared with or used by third parties. The organization should distribute or share information on a need-to-know basis. For example, the entity may specify that a confidentiality agreement, non-disclosure arrangement, contract, or written agreement of some kind concerning the handling of information must be in place between the entity and the third party. The entity's Information Protection Program should specify circumstances for sharing of BES Cyber System Information with and use by third parties, for example, use of a non-disclosure agreement. The entity should then follow their documented program. These requirements do not mandate one specific type of arrangement.

Requirement R2:

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact, as that should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, the entity

must take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.

The justification for this requirement is pre-existing from previous versions of CIP and is also documented in FERC Order No. 706 and its associated Notice of Proposed Rulemaking.

If an applicable Cyber Asset is removed from the Physical Security Perimeter prior to action taken to prevent the unauthorized retrieval of BES Cyber System Information or destroying the data storage media, the responsible entity should maintain documentation that identifies the custodian for the data storage media while the data storage media is outside of the Physical Security Perimeter prior to actions taken by the entity as required in R2.

Media sanitization is the process used to remove information from system media such that reasonable assurance exists that the information cannot be retrieved or reconstructed. Media sanitization is generally classified into four categories: Disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances, such as the use of strong encryption on a drive used in a SAN or other media, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused, whereas purging techniques may be more appropriate for media that is ready for disposal.

The following information from NIST SP800-88 provides additional guidance concerning the types of actions that an entity might take to prevent the unauthorized retrieval of BES Cyber System Information from the Cyber Asset data storage media:

> Clear: One method to sanitize media is to use software or hardware products to overwrite storage space on the media with non-sensitive data. This process may include overwriting not only the logical storage location of a file(s) (e.g., file allocation table) but also may include all addressable locations. The security goal of the overwriting process is to replace written data with random data. Overwriting cannot be used for media that are damaged or not rewriteable. The media type and size may also influence whether overwriting is a suitable sanitization method [SP 800-36].
>
> Purge: Degaussing and executing the firmware Secure Erase command (for ATA drives only) are acceptable methods for purging. Degaussing is exposing the magnetic media to a strong magnetic field in order to disrupt the recorded magnetic domains. A degausser is a device that generates a magnetic field used to sanitize magnetic media. Degaussers are rated based on the type (i.e., low energy or high energy) of magnetic media they can purge. Degaussers operate using either a strong permanent magnet or an electromagnetic coil. Degaussing can be an effective method for purging damaged or inoperative media, for purging media with exceptionally large storage capacities, or for quickly purging diskettes. [SP 800-36] Executing the firmware Secure Erase command (for ATA drives only) and degaussing are examples of acceptable methods for purging. Degaussing of any hard drive assembly usually destroys the drive as the firmware that manages the device is also destroyed.

Destroy: There are many different types, techniques, and procedures for media destruction. Disintegration, Pulverization, Melting, and Incineration are sanitization methods designed to completely destroy the media. They are typically carried out at an outsourced metal destruction or licensed incineration facility with the specific capabilities to perform these activities effectively, securely, and safely. Optical mass storage media, including compact disks (CD, CD-RW, CD-R, CD-ROM), optical disks (DVD), and MO disks, must be destroyed by pulverizing, crosscut shredding or burning.

In some cases such as networking equipment, it may be necessary to contact the manufacturer for proper sanitization procedure.

It is critical that an organization maintain a record of its sanitization actions to prevent unauthorized retrieval of BES Cyber System Information. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

October 28, 2014

This Implementation Plan is a combination of the effective dates for CIP-006-6 and CIP-009-6 from the initial ballot and the effective dates for the version X standards from the additional ballot. This Implementation Plan does not apply to standards revised to address the "Low Impact" and "Transient Device" directives from FERC Order No. 791. Those revisions require additional development and will be addressed in future versions of the standards with an associated Implementation Plan.

Requested Approvals

- CIP-003-6 — Cyber Security — Security Management Controls
- CIP-004-6 — Cyber Security — Personnel & Training
- CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-6 — Cyber Security — Systems Security Management
- CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-2 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-2 — Cyber Security — Information Protection

Requested Retirements

- CIP-003-5 — Cyber Security — Security Management Controls
- CIP-004-5.1 — Cyber Security — Personnel & Training
- CIP-006-5 — Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-5 — Cyber Security — Systems Security Management
- CIP-009-5 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-1 — Cyber Security — Configuration Change Management and Vulnerability Assessments

- CIP-011-1 — Cyber Security — Information Protection

Effective Dates

The effective dates for each of the proposed Reliability Standards are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply with that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-6 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-6, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-6.

2. CIP-004-6 — Cyber Security — Personnel & Training

   Reliability Standard CIP-004-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems

   Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-006-6, Requirement R1, Part 1.10

   For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

4. CIP-007-6 —Cyber Security — Systems Security Management

   Reliability Standard CIP-007-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on

the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

6. CIP-010-2 — Cyber Security — Configuration Change Management and Vulnerability Assessments

Reliability Standard CIP-010-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

7. CIP-011-2 — Cyber Security — Information Protection

Reliability Standard CIP-011-2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where

approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

8. Standards for Retirement

CIP-003-5 shall retire at midnight of the day immediately prior to the effective date of CIP-003-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-004-5.1 shall retire at midnight of the day immediately prior to the effective date of CIP-004-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-006-5 shall retire at midnight of the day immediately prior to the effective date of CIP-006-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-007-5 shall retire at midnight of the day immediately prior to the effective date of CIP-007-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-009-5 shall retire at midnight of the day immediately prior to the effective date of CIP-009-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-010-1 shall retire at midnight of the day immediately prior to the effective date of CIP-010-2 in the particular jurisdiction in which the new standard is becoming effective.

CIP-011-1 shall retire at midnight of the day immediately prior to the effective date of CIP-011-2 in the particular jurisdiction in which the new standard is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*
  - For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.

- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[1] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2014-02 CIP Version 5 Revisions

~~September 3, 2014~~October 28, 2014

Requested Approvals

- CIP-003-~~X~~ 6 — Cyber Security — Security Management Controls
- CIP-004-~~X~~ 6 — Cyber Security — Personnel ~~and~~& Training
- CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-~~X~~ 6 — Cyber Security — Systems Security Management
- CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-~~X~~ 2 — Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-~~X~~ 2 — Cyber Security — Information Protection

Requested Retirements

- CIP-003-5 — Cyber Security — Security Management Controls
- CIP-004-5.1 — Cyber Security — Personnel ~~and~~& Training
- CIP-006-5 — Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-5 — Cyber Security — Systems Security Management
- CIP-009-5 — Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-1 — Cyber Security — Configuration Change Management and Vulnerability Assessments

This Implementation Plan is a combination of the effective dates for CIP-006-6 and CIP-009-6 from the initial ballot and the effective dates for the version X standards from the additional ballot. This Implementation Plan does not apply to standards revised to address the "Low Impact" and "Transient Device" directives from FERC Order No. 791. Those revisions require additional development and will be addressed in future versions of the standards with an associated Implementation Plan. ~~**The standard version numbers currently include an (X) to indicate the version numbering will be updated. CIP-003-6 and CIP-010-2 for addressing the low impact assets and transient devices directives respectively were substantively revised and are posted concurrent with the IAC posting package. Depending on the ballot results of CIP-003-6 and CIP-010-2, NERC will assign the appropriate version number prior to NERC Board of Trustees adoption. The version X implementation plan is posted in a clean version although it draws upon the implementation plan from the previous posting and only includes language for those standards balloted as version X.**~~

- CIP-011-1 — Cyber Security — Information Protection

Prerequisite Approvals

None

Revisions to Defined Terms in the NERC Glossary

None

~~**General Considerations**~~

~~The results of the initial CIP V5 Revisions ballot showed industry support for the new communication networks requirements and the removal of the identify, assess, and correct (IAC) language from 17 requirements. These two directive areas have a FERC filing deadline of February 3, 2015.~~

~~The CIP-003-6 and CIP-010-2 revisions proposed to address the low impact and transient devices directives did not pass initial ballot. As a prudent approach and in order to meet the FERC filing deadline of February 3, 2015 for the two directives, the SDT would like to ballot the IAC revisions on their own without the low impact and transient devices revisions. Assuming the IAC revisions pass the second ballot, these standards can proceed to final ballot along with the communication networks revisions.~~

~~The SDT emphasizes that this is NOT an indication that it plans to separate the revision work. Strong progress continues on the low impact and transient devices revisions, and the SDT still hears support from stakeholders to complete all four directive areas of FERC Order No. 791 revisions at the same time. The request for a separate ballot is a practical measure to avoid potential complications with meeting FERC's directive deadlines that, if we were to wait until after the second ballot, time may not allow us to address.~~

~~The SDT plans to post a single ballot for the standards that need stakeholder approval for the IAC language removal. These proposed standards will be version X for the ballot. The version X ballot will be posted along with the other revision proposals designated with the appropriate version number. This allows for the simultaneous revision of the standards to address the directive issue areas and when both the version X and the numbered version standards pass ballot, the revisions can be combined into the appropriate numbered standard version.~~

Effective Dates

The effective dates for each of the proposed Reliability Standards ~~and NERC Glossary terms~~ are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular element (i.e., an entire Requirement or a portion thereof) of a proposed Reliability Standard, the additional time for compliance with that element is specified below. The compliance date for those particular elements represents the date that entities must begin to comply with that particular element of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

1. CIP-003-~~X~~ 6 — Cyber Security — Security Management Controls

   Reliability Standard CIP-003-~~X~~ 6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

   Compliance Date for CIP-003-~~X~~6, Requirement R2

   Registered Entities shall not be required to comply with Reliability Standard CIP-003-~~X~~6, Requirement R2 until the later of April 1, 2017 or nine calendar months after the effective date of Reliability Standard CIP-003-~~X~~6.

2. CIP-004-~~X~~ 6 — Cyber Security — Personnel ~~and~~& Training

   Reliability Standard CIP-004-~~X~~ 6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the later of April 1, 2016 or first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

3. CIP-006-6 — Cyber Security — Physical Security of BES Cyber Systems

Reliability Standard CIP-006-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-006-6, Requirement R1, Part 1.10

For new high or medium impact BES Cyber Systems at Control Centers identified by CIP-002-5.1 which were not identified as Critical Cyber Assets in CIP Version 3, Registered Entities shall not be required to comply with Reliability Standard CIP-006-6, Requirement R1, Part 1.10 until nine calendar months after the effective date of Reliability Standard CIP-006-6.

~~3.~~4. CIP-007-~~X~~6 —Cyber Security — Systems Security Management

Reliability Standard CIP-007-~~X~~6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for CIP-007-~~X~~6, Requirement R1, Part 1.2

Registered Entities shall not be required to comply with the elements of Reliability Standard CIP-007-~~X~~6, Requirement R1, Part 1.2 that apply to PCAs and nonprogrammable communication components located inside a PSP and inside an ESP and associated with High and Medium Impact BES Cyber Systems until nine calendar months after the effective date of Reliability Standard CIP-007-~~X~~6.

5. CIP-009-6 — Cyber Security — Recovery Plans for BES Cyber Systems

Reliability Standard CIP–009-6 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

~~4.~~6. CIP-010-~~X~~ 2 — Cyber Security — Configuration Change Management and Vulnerability Assessments

Reliability Standard CIP-010-~~X~~ 2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

~~5.~~7. CIP-011-~~X~~ 2 — Cyber Security — Information Protection

Reliability Standard CIP-011-~~X~~ 2 shall become effective on the later of April 1, 2016 or the first day of the first calendar quarter that is three calendar months after the date that the standard is approved by an applicable governmental authority, or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective the later of April 1, 2016 or on the first day of the first calendar quarter that is three calendar months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

~~6.~~8. Standards for Retirement

~~Midnight of the day immediately prior to the Effective Date in the particular jurisdiction in which the new standard or definition is becoming effective.~~

CIP-003-5 shall retire at midnight of the day immediately prior to the effective date of CIP-003-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-004-5.1 shall retire at midnight of the day immediately prior to the effective date of CIP-004-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-006-5 shall retire at midnight of the day immediately prior to the effective date of CIP-006-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-007-5 shall retire at midnight of the day immediately prior to the effective date of CIP-007-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-009-5 shall retire at midnight of the day immediately prior to the effective date of CIP-009-6 in the particular jurisdiction in which the new standard is becoming effective.

CIP-010-1 shall retire at midnight of the day immediately prior to the effective date of CIP-010-2 in the particular jurisdiction in which the new standard is becoming effective.

CIP-011-1 shall retire at midnight of the day immediately prior to the effective date of CIP-011-2 in the particular jurisdiction in which the new standard is becoming effective.

Certain Compliance Dates in the Implementation Plan for Version 5 CIP Cyber Security Standards Remain the Same

The following sections of the Implementation Plan for Version 5 CIP Cyber Security Standards[1] (Version 5 Plan) remain the same:

- *Initial Performance of Certain Periodic Requirements*

- For those requirements with recurring periodic obligations, refer to the Version 5 Plan for compliance dates. These compliance dates are not extended by the effective date of CIP Version 5 Revisions.

- *Previous Identity Verification*
  - The same concept in this section applies for CIP Version 5 Revisions. A documented identity verification performed pursuant to a previous version of the CIP Cyber Security Standards does not need to be repeated under CIP-004-6, Requirement R3, Part 3.1.
- *Planned or Unplanned Changes Resulting in a Higher Categorization*
  - The same concept applies for CIP Version 5 Revisions.

Unplanned Changes Resulting in Low Impact Categorization

For *unplanned* changes resulting in a low impact categorization where previously the asset containing BES Cyber Systems had no categorization, the Responsible Entity shall comply with all Requirements applicable to low impact BES Cyber Systems within 12 calendar months following the identification and categorization of the affected BES Cyber System.

[1] Implementation Plan for Version 5 CIP Cyber Security Standards, October 26, 2012, available online at http://www.nerc.com/pa/Stand/CIP00251RD/Implementation_Plan_clean_4_(2012-1024-1352).pdf

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791

October 28, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data	Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	1600 data request and will be working with the six study participants in developing the information needed for its filing.
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-6 Requirement Part 1.2 include applicability for non-programmable electronic components to prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The requirements modifications as well as the existing requirements have more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees	NERC modified the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[3] *See infra* P 223.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5,	NERC modified the VRF assignment for CIP-004-5.1, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		2. **VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the timeframe contained in the VSLs from 90-210 days to 90-120 days.

Consideration of Issues and Directives

Federal Energy Regulatory Commission Order No. 791

~~September 3, 2014~~October 28, 2014

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
67 and 76	67. For the reasons discussed below, the Commission concludes that the "identify, assess, and correct" language, as currently proposed by NERC, is unclear with respect to the obligations it imposes on responsible entities, how it would be implemented by responsible entities, and how it would be enforced. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements, while retaining the substantive provisions of those requirements.[1] Alternatively, NERC may propose equally efficient and effective modifications that address the Commission's concerns	The Standard Drafting Team (SDT) removed the "identify, assess, and correct" language from the following 17 Requirements in the CIP standards and their related Violation Severity Levels (VSLs): CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1.

[1] The 17 requirements are: CIP-003-5, Requirements R2 and R4; CIP-004-5, Requirements R2 through R5; CIP-006-5 Requirements R1 and R2; CIP-007-5, Requirements R1 through R5; CIP-009-5, Requirement R2; CIP-010-1, Requirements R1 and R2; and CIP-011-1, Requirement R1.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	regarding the "identify, assess, and correct" language.[2] The Commission directs NERC to submit the modifications to the CIP Reliability Standards within one year from the effective date of this Final Rule. 76. Accordingly, the Commission directs NERC, pursuant to section 215(d)(5) of the FPA, to develop modifications to the CIP version 5 Standards that address our concerns. Preferably, NERC should remove the "identify, assess, and correct" language from the 17 CIP version 5 requirements. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this Final Rule. Alternatively, NERC may develop a proposal to enhance the enforcement discretion afforded to itself and the Regional Entities, as discussed above.	
~~106~~	~~Based on the explanations provided by NERC and other commenters, we adopt the NOPR proposal with modifications. As we explain below, while we do not require NERC to develop specific controls for Low Impact~~	~~The SDT revised Requirements R1 and R2 of CIP-003-6 to include additional specificity regarding the processes that responsible entities must have for low impact BES Cyber Systems. In addition, the SDT developed objective criteria~~

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 186, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	~~facilities, we do require NERC to address the lack of objective criteria against which NERC and the Commission can evaluate the sufficiency of an entity's protections for Low Impact assets. While NERC may address this concern by developing specific controls for Low Impact facilities, it has the flexibility to address it through other means, including those discussed below.~~	~~surrounding the controls for some entities based on asset type and routable communications. The SDT determined that the additional specificity and objective criteria address FERC's concerns while maintaining the flexibility in controls necessary for such a diverse array of assets in the low impact category.~~ ~~To better define the protection required for low impact BES Cyber System electronic communication, the terms Low Impact BES Cyber System External Routable Connectivity (LERC) and Low Impact BES Cyber System Electronic Access Point (LEAP) have been added to the NERC Glossary of Terms. These help define the concept of security controls targeted for communication paths at a facility site level.~~ ~~The SDT confined these revisions in CIP-003-6, Requirements R1 and R2 to the following areas:~~ ~~1. **Cyber Security Policy:** R1.2 requires a policy addressing the four cyber security subject matter areas specified in the R2 cyber security plan.~~ ~~2. **Cyber Security Plan(s):** R2 requires the development and implementation of one or more cyber security plan(s) for an entity's low impact BES Cyber System(s). The cyber security plan must cover the 4 areas as~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~specified in Attachment 1 of CIP-003-6:~~ ~~a. **Cyber Security Awareness:** Attachment 1, element 1 requires responsible entities to implement a security awareness program with timeframes to reinforce cyber security practices. The SDT determined that adding intervals increases the auditability of the requirement part.~~ ~~b. **Physical Security Controls:** Attachment 1, element 2 and its subparts require controls to restrict physical access to low impact BES Cyber Systems as well as Low Impact BES Cyber System Electronic Access Points (LEAP) used for controlling access as specified in element 3.~~ ~~c. **Electronic Access Controls:** Attachment 1, element 3 and its subparts address protections around Low Impact BES Cyber System External Routable Connectivity (LERC) and Dial-up Connectivity.~~ ~~d. **Cyber Security Incident Response:** Attachment 1, element 4 and its subparts outline the criteria required to be in a Cyber Security Incident response plan.~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
124	Accordingly, the Commission directs NERC to conduct a survey of Cyber Assets that are included or excluded under the new BES Cyber Asset definition during the CIP version 5 Standards implementation periods. Such data will help provide a better understanding of the BES Cyber Asset definition. Based on the survey data, NERC should explain in an informational filing the following: (1) specific ways in which entities determine which Cyber Assets meet the 15 minute parameter; (2) types or functions of Cyber Assets that are excluded from being designated as BES Cyber Assets and the rationale as to why; (3) common problem areas with entities improperly designating BES Cyber Assets; and (4) feedback from each region participating in the implementation study on lessons learned with the application of the BES Cyber Asset definition. The informational filing should not provide a level of detail that divulges CEII data. This filing should also help other entities implementing CIP version 5 in identifying BES Cyber Assets.	Based on comments and feedback from the draft proposed Section 1600 survey, NERC will no longer be issuing a Section 1600 data request and will be working with the six study participants in developing the information needed for its filing.
~~132~~	~~Based on the explanation provided by NERC and other commenters, we will not direct modifications regarding the 30-day exemption in the definition of BES Cyber Asset. While we are persuaded that it would be unduly burdensome for responsible entities~~	~~The threat of connecting transient devices to BES Cyber Systems is addressed in the Reliability Standards through an additional requirement in CIP-010, which requires a Transient Cyber Asset and Removable Media plan to provide higher assurance against the propagation of malware when connecting transient devices.~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	~~to treat all transient devices as BES Cyber Assets, we remain concerned whether the CIP version 5 Standards provide adequately robust protection from the risks posed by transient devices. Accordingly, as discussed below, we direct NERC to develop either new or modified standards to address the reliability risks posed by connecting transient devices to BES Cyber Assets and Systems.~~	~~The terms Transient Cyber Asset and Removable Media have been added to the glossary to define transient devices. In addition, the terms BES Cyber Asset and Protected Cyber Asset have been modified to reference the new Transient Cyber Asset definition.~~ ~~The drafting team determined three distinct scenarios for entities to address in their plan(s) in which transient devices need specific protections: (i) Transient Cyber Assets owned or managed by the Responsible Entity, (ii) Transient Cyber Asset(s) owned or managed by vendors or contractors, and (iii) Removable Media.~~ ~~For Transient Cyber Assets owned or managed by the Responsible Entity, the SDT determined that entities manage these devices in two fundamentally different ways. Some entities maintain a preauthorized inventory of transient devices while others have a checklist for transient devices prior to connecting them to a BES Cyber System. The drafting team acknowledges both methods are valid and has drafted requirements that permit either form of management. The controls for this scenario are more specific and recognize the relatively higher frequency in which these devices will be used.~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~In the scenario in which contractors or vendors manage the Transient Cyber Assets, the required elements of the plan include those which an entity can verify at the point prior to connecting such as security patch management and malware prevention mechanisms.~~ ~~The security controls entities must apply to Removable Media have considerations for the type of device being protected and include authorization and scanning for malicious code.~~ ~~The Commission provided a list of security controls it expected NERC to consider for addressing transient devices. The consideration of each security element is described as follows:~~ ~~1. **Device authorization as it relates to users and locations:** CIP-010-2 Requirement R4, Attachment 1 requires entities to authorize Transient Cyber Assets and Removable Media by individual(s) and location(s) prior to connecting them to the BES Cyber System. Vendor or contractor managed Transient Cyber Assets do not have this authorization because the scenario is often single-use and the entity already conducts an inspection and mitigation of the device prior to connection.~~ ~~2. **Software authorization:** The SDT considered controls relating to software authorization but decided against including specific software as part of the authorization performance because such authorization did not~~

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~contribute meaningfully to cyber security risk reduction. However, software authorization in the form of application whitelisting is provided as an option to mitigate malicious code.~~ ~~3. **Security patch management:** In CIP-010-2 R4, Attachment 1, both entity and vendor/contractor managed devices must have security patch management or other equivalent forms of mitigation to address security vulnerabilities in software.~~ ~~4. **Malware prevention:** CIP-010-2 Requirement R4, Attachment 1 requires entities to have malware protection on the Transient Cyber Asset (for both entity- and vendor-managed Transient Cyber Assets) and for Removable Media prior to connection.~~ ~~5. **Detection controls for unauthorized physical access to a transient device:** The drafting team considered this control and determined this control best applies to entity-managed Transient Cyber Assets with the objective to mitigate the risk of unauthorized use. There are logistical challenges in applying this control to vendor-managed devices, in which the entity likely will have had no control until immediately prior to use. Furthermore, additional guidance is necessary in CIP-011-2 to ensure entities recognize the importance of safeguarding BES Cyber System Information on transient

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		~~devices. The objective to address the unauthorized release of BES Cyber System Information is sufficiently addressed with the requirements in CIP-011-2 to protect and securely handle BES Cyber System Information.~~ ~~6. **Processes and procedures for connecting transient devices to systems at different security classification levels (i.e. High, Medium, Low Impact):** The drafting team has considered this control and believes the threat of connecting at multiple impact levels is sufficiently addressed through the proposed Reliability Standards. Rigorous security assessment and controls between classification levels have significant importance to secure authorized information flows. However, connections between impact levels do not carry the same threat for BES Cyber Systems. The flow of BES Cyber System Information is addressed sufficiently through CIP-011-2 requirements. The more concerning threat involves transient devices connecting between BES Cyber Systems and external networks, and this threat is addressed in the proposed CIP-010-2 Requirement R4.~~
150	We direct NERC to create a definition of communication networks and to develop new or modified Reliability Standards to address the reliability gap discussed above. The definition of communications networks should define what	The proposed CIP-006-6 Requirement Part 1.10 requires the physical protection of nonprogrammable components of BES Cyber Systems existing outside of the PSP, and the proposed modifications to CIP-007-6 Requirement Part 1.2 include applicability for non-programmable electronic components to

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	equipment and components should be protected, in light of the statutory inclusion of communication networks for the reliable operation of the Bulk-Power System. The new or modified Reliability Standards should require appropriate and reasonable controls to protect the nonprogrammable aspects of communication networks. The Commission directs NERC to submit these modifications for Commission approval within one year from the effective date of this final rule. We also direct Commission staff to include this issue in the staff-led technical conference discussed herein.3	prevent unauthorized use of physical ports. These additional requirements address the gap in protection as discussed in the Order by ensuring the physical security for cabling and non-programmable network components not covered by the definition of Cyber Asset. The drafting team reviewed the directives related to submitting a definition for communication network and determined it could address the gap in protection and adequately provide guidance on nonprogrammable electronic components without having a definition. Communication networks can and should be defined broadly. For example, NIST Special Publication 800-53 Revision 4 refers to the CNSSI 4009 definition of Network, which is "Information system(s) implemented with a collection of interconnected components." The requirements modifications as well as the existing requirements have more targeted components. Consequently, there is not a need at this time to submit a definition for the NERC Glossary of Terms used in Reliability Standards.
181 and 184	181. The Commission also supports NERC's proposal to develop transition guidance documents and a pilot program to assist responsible entities as they move	NERC modified the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[3] *See infra* P 223.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	from compliance with the CIP version 3 Standards to the CIP version 5 Standards.4 The Commission agrees that a pilot program will assist responsible entities by offering best practices and lessons learned during this transition. 184. Consistent with our discussion above, the Commission directs NERC to modify the VRF assignment for CIP-006-5, Requirement R3 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
192 and 196	192. The Commission adopts the NOPR proposal and directs NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium. This modification is necessary to reflect that access to operationally sensitive computer equipment should be strictly limited to employees or contractors who utilize the equipment in performance of their job responsibilities, and to prevent or mitigate disclosure of sensitive information consistent with Recommendations 40 and 44 of the 2003 Blackout Report. In addition, a Medium VRF assignment	NERC modified the VRF assignment for CIP-004-5.1, Requirement R4 from Lower to Medium and filed the revision with FERC on 5/15/2014.

[4] *See* NERC Comments at 39-40.

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
	ensures consistency with the Commission's VRF guidelines. 196. Consistent with the discussion above, we direct NERC to modify the VRF assignment for CIP-004-5, Requirement R4 from Lower to Medium, within 90 days of the effective date of this Final Rule.	
205	Consistent with the NOPR proposal, we direct NERC to develop modifications to the VSLs for certain CIP version 5 Standard requirements to: (1) remove the "identify, assess, and correct" language from the text of the VSLs for the affected requirements; (2) address typographical errors; and (3) clarify certain unexplained elements. For the VSLs that include "identify, assess, and correct" language, we direct NERC to ensure that these VSLs are modified to reflect any revisions to the requirement language in response to our directives. We grant NERC the discretion to decide how best to address these modifications be it through an errata filing to this proceeding or separate filing.	In conjunction with the SDT's response to the directive in PP 67 and 76, the SDT removed the "identify, assess, and correct" language from the following 17 Requirements' VSLs: CIP-003-6, Requirements R2 and R4; CIP-004-6, Requirements R2, R3, R4, and R5; CIP-006-6, Requirements R1 and R2; CIP-007-6, Requirements R1, R2, R3, R4, and R5; CIP-009-6, Requirement R2; CIP-010-2, Requirements R1 and R2; and CIP-011-2, Requirement R1. NERC filed the following revisions with FERC on 5/15/2014: 1. **VSLs for CIP-003-5, Requirements R1 and R2**. This standard addresses security management controls for cyber security. Requirement R1 governs management approval of policies on topics addressed in other CIP standards for medium and high impact BES Cyber Systems. Requirement R2 governs policies for low impact

Directives from Order 791		
Paragraph	**Directive Language**	**Consideration of Issue or Directive**
		BES Cyber Systems. NERC staff, in consultation with the SDT, revised the VSLs in CIP-003-5, Requirements R1 and R2 to eliminate redundant language. 2. **VSLs for CIP-004-5.1, Requirement R4**. This standard includes requirements for personnel and training related to cyber security. Requirement R4 governs implementation of access management programs. NERC staff, in consultation with the SDT, revised the VSLs to a percentage-based gradation. 3. **Severe VSL for CIP-008-5, Requirement R2**. This standard addresses incident reporting and response planning for cyber security. Requirement R2 governs implementation of documented Cyber Security Incident response plans. NERC staff revised the Severe VSL to reduce a gap in months between the High VSL and Severe VSL. 4. **VSLs for CIP-009-5, Requirement R3**. This standard addresses recovery plans for BES Cyber Systems. Requirement R3 governs maintenance of the recovery plans. NERC staff revised the

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.
CIP-007-5 R3	CIP-007-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-6, CIP-004-6, CIP-006-6, CIP-007-6, CIP-009-6, CIP-010-2, and CIP-011-2 (CIP-002-5, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-6 R1	~~To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.~~No change.
~~NEW~~	~~CIP-003-6 R1.1~~	~~"For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.~~
CIP-003-5 R1.1	CIP-003-6 R1.1~~.1~~	~~Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-6.~~ No change.
CIP-003-5 R1.2	CIP-003-6 R1.~~1.~~2	No change.
CIP-003-5 R1.3	CIP-003-6 R1.~~1.~~3	No change.
CIP-003-5 R1.4	CIP-003-6 R1.~~1.~~4	No change.
CIP-003-5 R1.5	CIP-003-6 R1.~~1.~~5	No change.
CIP-003-5 R1.6	CIP-003-6 R1.~~1.~~6	No change.
CIP-003-5 R1.7	CIP-003-6 R1.~~1.~~7	No change.
CIP-003-5 R1.8	CIP-003-6 R1.~~1.~~8	No change.
CIP-003-5 R1.9	CIP-003-6 R1.~~1.~~9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
~~NEW~~	~~CIP-003-6 R1.2~~	~~"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.~~
CIP-003-5 R2	CIP-003-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. ~~Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1."~~
CIP-003-5 R2.1	CIP-003-6 R~~1.2.1~~2.1	~~The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.1~~No change.
CIP-003-5 R2.2	CIP-003-6, R~~1.2.2~~2.2	~~The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.2.~~No change.
CIP-003-5 R2.3	CIP-003-6 R~~1.2.3~~2.3	~~The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity."~~ No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.4	CIP-003-6 R~~1.2.4~~2.4	~~The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.4.~~ No change.
~~NEW~~	~~CIP-003-6, Attachment 1~~	~~CIP-003-6 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.~~
CIP-003-5 R3	CIP-003-6 R3	No change.
CIP-003-5 R4	CIP-003-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-6 R1	No change.
CIP-004-5.1 R1.1	CIP-004-6 R1.1	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2	CIP-004-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. ~~The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement "a cyber security training program(s)." That modification was made for clarity and consistency across the standards.~~
CIP-004-5.1 R2.1	CIP-004-6 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-6 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-6 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-6 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-6 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-6 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-6 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-6 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-6 R2.1.8	No change.
~~CIP-004-5.1 R2.1.9~~	~~CIP-004-6 R2.1.9~~	~~To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity's cyber security training program. The training must address cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.~~
CIP-004-5.1 R2.2	CIP-004-6 R2.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.3	CIP-004-6 R2.3	No change.
CIP-004-5.1 R3	CIP-004-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R3.1	CIP-004-6 R3.1	No change.

CIP-006-5 R1.9	CIP-006-6 R1.9	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection again the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.
CIP-007-5 R3	CIP-007-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R3.1	CIP-007-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R3.2	CIP-007-6 R3.2	No change.
CIP-007-5 R3.3	CIP-007-6 R3.3	No change.
CIP-007-5 R4	CIP-007-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R4.1	CIP-007-6 R4.1	No change.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Project 2014-02 - Cyber Security - Order No. 791 Identify, Assess, and Correct and Communication Networks Directives

Violation Risk Factor and Violation Severity Level Justifications

The tables in this document provide a working draft of the analysis and justification for each Violation Risk Factor (VRF) and Violation Severity Level (VSL) for each requirement in the CIP Cyber Security Standards revisions that address the Order No. 791 identify, assess, and correct and communication networks directives.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The CIP Version 5 Revisions Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria – VRFs

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC VRF Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the VRF Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria - VSLs

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital Component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Orders on VSLs

In its June 19, 2008 Order on VSLs, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: VSL Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

- Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: VSL Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

- Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.
- Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: VSL Assignment Should Be Consistent with the Corresponding Requirement

- VSLs should not expand on what is required in the requirement.

Guideline 4: VSL Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

In its March 18, 2010 Order Addressing VSL Assignments in CIP Standards, FERC offered the following additional guidance relative to VSLs for CIP requirements:

Guideline 5: Requirements Where Single Lapse in Protection Result in Compromised Computer Network Security

Requirements where a single lapse in protection can compromise computer network security, i.e., the "weakest link" characteristic, should apply binary rather than gradated Violation Severity Levels.

Guideline 6: VSLs Should Account for Interdependent Tasks

Violation Severity Levels for cyber security Requirements containing interdependent tasks of documentation and implementation should account for their interdependence.

VRF and VSL Justifications – CIP-003-6, R2	
Proposed VRF	**LOWER**
NERC VRF Discussion	A VRF of Lower was assigned to this requirement. Security policies enable effective implementation of the CIP standard's requirements. The purpose of policies is to provide a management and governance foundation for all requirements that apply to personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems. People are a fundamental component of any security program. Consequently, proper governance must be established in order to provide some assurance of organizational behavior. However, given the scoping of the this requirement to only those BES assets that contain low impact BES Cyber Systems, a VRF of Lower was selected.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for the Responsible Entity to implement a documented cyber security policy that contains certain elements specified in the requirement. The VRF is only applied at the requirement level and the Requirement Parts are treated in aggregate. While the requirement specifies a number of elements, not necessarily parts, that must be included in the cyber security policy, the VRF is reflective of the policy as a whole. Therefore, the assigned VRF of Lower is consistent with the risk impact of a violation across the entire requirement for BES assets that contain low impact BES Cyber Systems.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards.

VRF and VSL Justifications – CIP-003-6, R2			
	This requirement maps from CIP-003-5, R1, which has an approved VRF of Lower but applies to Cyber Assets with an inherently lower risk; therefore, the proposed VRF is consistent.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to properly implement the cyber security policy would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The cyber security policy requirement encompasses a number of policy domains. The VRF is identified at the risk level represented by all of the policy domains in aggregate. Therefore, the VRF is consistent with the highest risk reliability objective contained in the requirement.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity had one or more documented cyber security policies for assets with a low impact rating but failed to address one of the topics as required by Requirement R2. (R2) OR The Responsible Entity did not complete its review of the one or more documented cyber	The Responsible Entity had one or more documented cyber security policies for assets with a low impact rating but failed to address two of the topics as required by Requirement R2. (R2) OR The Responsible Entity did not complete its review of the one or more documented cyber	The Responsible Entity had one or more documented cyber security policies for assets with a low impact rating but failed to address three of the topics as required by Requirement R2. (R2) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for assets with a low	The Responsible Entity did not have any documented cyber security policies for assets with a low impact rating that address the topics as required by Requirement R2. (R2) OR The Responsible Entity did not complete its review of the one or more documented cyber security policies for assets with a low

VRF and VSL Justifications – CIP-003-6, R2			
security policies for assets with a low impact rating as required by Requirement R2 within 15 calendar months but did complete this review in less than or equal to 16 calendar months of the previous review. (R2) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for assets with a low impact rating as required by Requirement R2 by the CIP Senior Manager within 15 calendar months but did complete this approval in less than or equal to 16 calendar months of the previous approval. (R2)	security policies for assets with a low impact rating as required by Requirement R2 within 16 calendar months but did complete this review in less than or equal to 17 calendar months of the previous review. (R2) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for assets with a low impact rating as required by Requirement R2 by the CIP Senior Manager within 16 calendar months but did complete this approval in less than or equal to 17 calendar months of the previous approval. (R2)	impact rating as required by Requirement R2 within 17 calendar months but did complete this review in less than or equal to 18 calendar months of the previous review. (R2) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for assets with a low impact rating as required by Requirement R2 by the CIP Senior Manager within 17 calendar months but did complete this approval in less than or equal to 18 calendar months of the previous approval. (R2)	impact rating as required by Requirement R2 within 18 calendar months of the previous review. (R2) OR The Responsible Entity did not complete its approval of the one or more documented cyber security policies for assets with a low impact rating as required by Requirement R2 by the CIP Senior Manager within 18 calendar months of the previous approval. (R2)

VRF and VSL Justifications – CIP-003-6, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-003-5 R2. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.

VRF and VSL Justifications – CIP-003-6, R2	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations.

VRF and VSL Justifications – CIP-003-6, R2	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	There is an incremental aspect to a violation of this requirement in that some measurable reliability benefit can be achieved if the Responsible Entity has documented cyber security policies but fails to address one or more of the required topics. A single failure of this requirement does not compromise network computer security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The action of the requirement is to implement documented cyber security policies. Documentation of the policies is required, but is not the primary objective of the requirement. Documentation is interdependent with the implementation of the policy in this case; as such, the VSL measures distance from compliance in terms of whether or not the Responsible Entity "addressed" all the required elements of the policy. The drafting team's intent is that this covers both documentation and implementation and, therefore, accounts for the interdependence of these tasks.

VRF and VSL Justifications – CIP-003-6, R4	
Proposed VRF	**LOWER**
NERC VRF Discussion	The reliability purpose of this requirement is to ensure clear lines of authority and ownership for security matters that could impact the stability and integrity of the Bulk Electric System, that delegations are kept up-to-date, and that individuals do not assume undocumented authority. As this requirement is only a part of the overall governance structure of a cyber security program, which includes additional leadership and policy, a VRF of Lower was assigned to this requirement.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement directs that the CIP Senior Manager is responsible for all approval and authorizations, but also grants the CIP Senior Manager with the ability to delegate this authority. The Requirement also calls for changes to the CIP Senior Manager and any delegations to be documented within 30 calendar days. The VRF is only applied at the requirement level, and the requirement parts are treated equally. The requirement does not contain parts and are, therefore, consistent.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This Requirement maps from CIP-003-5, R4, which has an approved VRF of Lower; therefore, the proposed VRF is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to show clear authorization for actions taken back to the CIP Senior Manager would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The obligation of this requirement is to demonstrate that the CIP Senior Manager is ultimately responsible for all approvals and authorizations required in the CIP Standards. This requirement allows for delegation, but also obligates the Responsible Entity to document these delegations. The VRF was chosen based upon the highest reliability risk objective, which is the clear line of authority to the CIP Senior Manager and are, therefore, consistent with VRF Guideline 5.

VRF and VSL Justifications – CIP-003-6, R4			
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has identified a delegate by name, title, date of delegation, and specific actions delegated, but did not document changes to the delegate within 30 calendar days but did document this change in less than 40 calendar days of the change. (R4)	The Responsible Entity has identified a delegate by name, title, date of delegation, and specific actions delegated, but did not document changes to the delegate within 40 calendar days but did document this change in less than 50 calendar days of the change. (R4)	The Responsible Entity has identified a delegate by name, title, date of delegation, and specific actions delegated, but did not document changes to the delegate within 50 calendar days but did document this change in less than 60 calendar days of the change. (R4)	The Responsible Entity has used delegated authority for actions where allowed by the CIP Standards, but does not have a process to delegate actions from the CIP Senior Manager. (R4) OR The Responsible Entity has identified a delegate by name, title, date of delegation, and specific actions delegated, but did not document changes to the delegate within 60 calendar days of the change. (R4)

VRF and VSL Justifications – CIP-003-6, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to the violation, and the VSLs follow the guidelines for incremental violations. There is a single element upon which severity may be gradated; as such, gradated VSLs were assigned.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-003-5 R4. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-003-6, R4	
Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single failure of this requirement does not compromise network computer security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The requirement contains interdependent tasks of documentation and implementation. The VSL requirement presumes that the only way to demonstrate compliance is through documentation; as such, the VSLs are based upon the documentation measure, and implementation is assumed with documentation, therefore accounting for the interdependence in these tasks.

VRF and VSL Justifications – CIP-004-6, R2			
Proposed VRF	**LOWER**		
NERC VRF Discussion	The reliability objective is to ensure that individuals with access to BES Cyber Systems have training in subjects related to the security of the BES Cyber System and appropriate to their role. Failure to meet this objective would not have adverse effect on the electrical state or capability of the Bulk Electric System.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for a training program for individuals needing or having access to the BES Cyber System. The VRF is only applied at the requirement level and the requirement parts are treated equally. Each requirement part contributes to the reliability objective.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-004-5.1, R2, which has an approved VRF of Lower.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to have a training program would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The proposed requirement has a single objective of ensuring that individuals with access to BES Cyber Systems have training in subjects related to the security of the BES Cyber System and appropriate to their role and, therefore, does not co-mingle more than one obligation.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity implemented a cyber security training program but failed to include one of	The Responsible Entity implemented a cyber security training program but failed to include two of the training	The Responsible Entity implemented a cyber security training program but failed to include three of the training	The Responsible Entity did not implement a cyber security training program appropriate to

VRF and VSL Justifications – CIP-004-6, R2			
the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train one individual (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train one individual with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train two individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train two individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train three individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train three individuals with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)	individual roles, functions, or responsibilities. (R2) OR The Responsible Entity implemented a cyber security training program but failed to include four or more of the training content topics in Requirement Parts 2.1.1 through 2.1.9. (2.1) OR The Responsible Entity implemented a cyber security training program but failed to train four or more individuals (with the exception of CIP Exceptional Circumstances) prior to their being granted authorized electronic and authorized unescorted physical access. (2.2) OR The Responsible Entity implemented a cyber security training program but failed to train four or more individuals

VRF and VSL Justifications – CIP-004-6, R2			
			with authorized electronic or authorized unescorted physical access within 15 calendar months of the previous training completion date. (2.3)

VRF and VSL Justifications – CIP-004-6, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-004-5.1 R2. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.

VRF and VSL Justifications – CIP-004-6, R2	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation,	The VSLs are based on a single violation and not cumulative violations.

VRF and VSL Justifications – CIP-004-6, R2	
Not on A Cumulative Number of Violations	
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single failure of this requirement does not compromise network computer security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	This VSL accounts for the interdependence of documentation and implementation and treats the failure to document a program as a Severe violation.

VRF and VSL Justifications – CIP-004-6, R3	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	The reliability objective is to ensure that individuals with access to BES Cyber Systems have training in subjects related to the security of the BES Cyber System and appropriate to their role. Failure to meet this objective could affect the electrical state or capability of the Bulk Electric System. However, it is unlikely to lead to instability.

VRF and VSL Justifications – CIP-004-6, R3	
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for implementing a training program for individuals needing or having access to the BES Cyber System. The VRF is only applied at the Requirement level and the requirement parts are treated equally. Each Requirement Part contributes to the reliability objective.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-004-5.1, R2, which has an approved VRF of Medium.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to implement a security training program could affect the electrical state or capability of the Bulk Electric System. However, it is unlikely to lead to instability.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The proposed requirement has a single objective of ensuring that individuals with access to BES Cyber Systems have training in subjects related to the security of the BES Cyber System and appropriate to their role and, therefore, does not co-mingle more than one obligation.

Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has a program for conducting Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, but did not conduct the PRA as a condition of granting authorized electronic or authorized unescorted	The Responsible Entity has a program for conducting Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, but did not conduct the PRA as a condition of granting authorized electronic or authorized unescorted	The Responsible Entity has a program for conducting Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, but did not conduct the PRA as a condition of granting authorized electronic or authorized unescorted physical access for three individuals. (R3) OR	The Responsible Entity did not have all of the required elements as described by 3.1 through 3.4 included within documented program(s) for implementing Personnel Risk Assessments (PRAs), for individuals, including contractors and service vendors, for obtaining and retaining

VRF and VSL Justifications – CIP-004-6, R3			
physical access for one individual. (R3) OR The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not confirm identity for one individual. (3.1 & 3.4) OR The Responsible Entity has a process to perform seven-year criminal history record checks for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not include the required checks described in 3.2.1 and 3.2.2 for one individual. (3.2 & 3.4) OR	physical access for two individuals. (R3) OR The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not confirm identity for two individuals. (3.1 & 3.4) OR The Responsible Entity has a process to perform seven-year criminal history record checks for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not include the required checks described in 3.2.1 and 3.2.2 for two individuals. (3.2 & 3.4) OR	The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not confirm identity for three individuals. (3.1 & 3.4) OR The Responsible Entity has a process to perform seven-year criminal history record checks for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not include the required checks described in 3.2.1 and 3.2.2 for three individuals. (3.2 & 3.4) OR The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical	authorized cyber or authorized unescorted physical access. (R3) OR The Responsible Entity has a program for conducting Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, but did not conduct the PRA as a condition of granting authorized electronic or authorized unescorted physical access for four or more individuals. (R3) OR The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not confirm identity for four or more individuals. (3.1 & 3.4) OR

VRF and VSL Justifications – CIP-004-6, R3			
The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not evaluate criminal history records check for access authorization for one individual. (3.3 & 3.4) OR The Responsible Entity did not conduct Personnel Risk Assessments (PRAs) for one individual with authorized electronic or authorized unescorted physical access within 7 calendar years of the previous PRA completion date. (3.5)	The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not evaluate criminal history records check for access authorization for two individuals. (3.3 & 3.4) OR The Responsible Entity did not conduct Personnel Risk Assessments (PRAs) for two individuals with authorized electronic or authorized unescorted physical access within 7 calendar years of the previous PRA completion date. (3.5)	access but did not evaluate criminal history records check for access authorization for three individuals. (3.5)	The Responsible Entity has a process to perform seven-year criminal history record checks for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not include the required checks described in 3.2.1 and 3.2.2 for four or more individuals. (3.2 & 3.4) OR The Responsible Entity did conduct Personnel Risk Assessments (PRAs) for individuals, including contractors and service vendors, with authorized electronic or authorized unescorted physical access but did not evaluate criminal history records check for access authorization for four or more individuals. (3.3 & 3.4) OR The Responsible Entity did not conduct Personnel Risk Assessments (PRAs) for four or

VRF and VSL Justifications – CIP-004-6, R3			
			more individuals with authorized electronic or authorized unescorted physical access within 7 calendar years of the previous PRA completion date. (3.5)

VRF and VSL Justifications – CIP-004-6, R3	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-004-5.1 R3. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-004-6, R3	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations. The requirement is to implement a training program and failure for a single individual to have training does not necessarily imply a single violation. An overall view of the training program must consider the number of individuals who failed to receive training for a given period.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single failure of this requirement does not compromise network computer security. Although failure to implement a training program could associatively affect the ways in which computer network security applies, it does not, by itself, indicate a failure of computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	This Requirement pertains to implementing the cyber security program and does not require procedural documentation.

VRF and VSL Justifications – CIP-004-6, R4			
Proposed VRF	**LOWER**		
NERC VRF Discussion	The reliability objective is to ensure that individuals with access to BES Cyber Systems have received a personnel risk assessment. Failure to meet this objective could have adverse effect on the electrical state or capability of the Bulk Electric System, but it is not expected to cause Bulk Electric System instability.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This Requirement calls for a personnel risk assessment program for individuals needing or having access to a BES Cyber System. The VRF is only applied at the requirement level and the requirement parts are treated equally. Each requirement part contributes to the reliability objective.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement's VRF is consistent with similar security requirements with similar risks in the other CIP standards.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to have a personnel risk assessment program could have adverse effect on the electrical state or capability of the Bulk Electric System, but it is not expected to cause Bulk Electric System instability.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The proposed requirement has a single objective of ensuring that documentation a personnel risk assessment is developed for individuals with access to BES Cyber Systems and, therefore, does not co-mingle more than one obligation.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity did not verify that individuals with active electronic or active unescorted physical access have authorization records	The Responsible Entity did not verify that individuals with active electronic or active unescorted physical access have authorization records	The Responsible Entity did not verify that individuals with active electronic or active unescorted physical access have authorization records during a calendar quarter	The Responsible Entity did not implement any documented program(s) for access management. (R4)

VRF and VSL Justifications – CIP-004-6, R4			
during a calendar quarter but did so less than 10 calendar days after the start of a subsequent calendar quarter. (4.2) OR The Responsible Entity has implemented processes to verify that user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and necessary within 15 calendar months of the previous verification but for one BES Cyber System, privileges were incorrect or unnecessary. (4.3) OR The Responsible Entity has implemented processes to verify that access to the designated storage locations for BES Cyber System Information is correct and	during a calendar quarter but did so between 10 and 20 calendar days after the start of a subsequent calendar quarter. (4.2) OR The Responsible Entity has implemented processes to verify that user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and necessary within 15 calendar months of the previous verification but for two BES Cyber Systems, privileges were incorrect or unnecessary. (4.3) OR The Responsible Entity has implemented processes to verify that access to the designated storage locations for BES Cyber System Information is correct and necessary within 15 calendar	but did so between 20 and 30 calendar days after the start of a subsequent calendar quarter. (4.2) OR The Responsible Entity has implemented processes to verify that user accounts, user account groups, or user role categories, and their specific, associated privileges are correct and necessary within 15 calendar months of the previous verification but for three BES Cyber Systems, privileges were incorrect or unnecessary. (4.3) OR The Responsible Entity has implemented processes to verify that access to the designated storage locations for BES Cyber System Information is correct and necessary within 15 calendar months of the previous verification but for three BES Cyber System Information storage	OR The Responsible Entity has implemented one or more documented program(s) for access management that includes a process to authorize electronic access, unescorted physical access, or access to the designated storage locations where BES Cyber System Information is located. (4.1) OR The Responsible Entity did not verify that individuals with active electronic or active unescorted physical access have authorization records for at least two consecutive calendar quarters. (4.2) OR The Responsible Entity has implemented processes to verify that user accounts, user account groups, or user role categories, and their specific, associated

VRF and VSL Justifications – CIP-004-6, R4			
necessary within 15 calendar months of the previous verification but for one BES Cyber System Information storage location, privileges were incorrect or unnecessary. (4.4)	months of the previous verification but for two BES Cyber System Information storage locations, privileges were incorrect or unnecessary. (4.4)	locations, privileges were incorrect or unnecessary. (4.4)	privileges are correct and necessary within 15 calendar months of the previous verification but for four or more BES Cyber Systems, privileges were incorrect or unnecessary. (4.3) OR The Responsible Entity has implemented processes to verify that access to the designated storage locations for BES Cyber System Information is correct and necessary within 15 calendar months of the previous verification but for four or more BES Cyber System Information storage locations, privileges were incorrect or unnecessary. (4.4)

VRF and VSL Justifications – CIP-004-6, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-004-5.1 R4. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-004-6, R4	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Failure to document or implement all required documented program(s) has a binary Severe VSL. Other Requirement Parts associated with the required processes do not indicate a single lapse compromising computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a program as a Severe violation while also accounting for the failure to implement the program using a gradation VSL methodology.

VRF and VSL Justifications – CIP-004-6, R5	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	This Requirement ensures prompt revocation of access for individuals no longer needing access to BES Cyber Systems and BES Cyber System Information. Failure to revoke access to BES Cyber Systems and BES Cyber System Information within the required time frame is an administrative requirement and is not expected to adversely affect the electrical state or capability of the Bulk Electric System.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for procedures to revoke access to BES Cyber Systems and BES Cyber System Information when individuals no longer need access. The VRF is only applied at the requirement level, and the Requirement Parts are treated equally. Each Requirement row contributes to the objective of this Requirement.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This Requirement maps from CIP-004-5.1, R5, which has an approved VRF of Medium. Therefore, the proposed VRF is consistent with the approved VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to revoke access to BES Cyber Systems and BES Cyber System Information may impact the reliability and operability of the BES. Therefore, and according to NERC VRF definitions, this Requirement, if violated, could directly affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. Requirement R5 requires prompt revocation of access for individuals no longer needing access to BES Cyber Systems and BES Cyber System Information. Each part of Requirement R5 specifies the obligations to revoke access in various situations when an individual no longer needs such access.

VRF and VSL Justifications – CIP-004-6, R5			
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has implemented one or more process(es) to revoke the individual's access to the designated storage locations for BES Cyber System Information but, for one individual, did not do so by the end of the next calendar day following the effective date and time of the termination action. (5.3) OR The Responsible Entity has implemented one or more process(es) to revoke the individual's user accounts upon termination action but did not do so for within 30 calendar days of the date of termination action for one or more individuals. (5.4) OR	The Responsible Entity has implemented one or more process(es) to remove the ability for unescorted physical access and Interactive Remote Access upon a termination action or complete the removal within 24 hours of the termination action but did not initiate those removals for one individual. (5.1) OR The Responsible Entity has implemented one or more process(es) to determine that an individual no longer requires retention of access following reassignments or transfers but, for one individual, did not revoke the authorized electronic access to individual accounts and authorized unescorted physical access by the end of the next calendar	The Responsible Entity has implemented one or more process(es) to remove the ability for unescorted physical access and Interactive Remote Access upon a termination action or complete the removal within 24 hours of the termination action but did not initiate those removals for two individuals. (5.1) OR The Responsible Entity has implemented one or more process(es) to determine that an individual no longer requires retention of access following reassignments or transfers but, for two individuals, did not revoke the authorized electronic access to individual accounts and authorized unescorted physical access by the end of the next calendar day following the predetermined date. (5.2)	The Responsible Entity has not implemented any documented program(s) for access revocation for electronic access, unescorted physical access, or BES Cyber System Information storage locations. (R5) OR The Responsible Entity has implemented one or more process(es) to remove the ability for unescorted physical access and Interactive Remote Access upon a termination action or complete the removal within 24 hours of the termination action but did not initiate those removals for three or more individuals. (5.1) OR The Responsible Entity has implemented one or more process(es) to determine that an individual no longer requires retention of access following

VRF and VSL Justifications – CIP-004-6, R5			
The Responsible Entity has implemented one or more process(es) to change passwords for shared accounts known to the user upon termination action, reassignment, or transfer, but did not do so for within 30 calendar days of the date of termination action, reassignment, or transfer for one or more individuals. (5.5) OR The Responsible Entity has implemented one or more process(es) to determine and document extenuating operating circumstances following a termination action, reassignment, or transfer, but did not change one or more passwords for shared accounts known to the user within 10 calendar days following the end of the extenuating operating circumstances. (5.5)	day following the predetermined date. (5.2) OR The Responsible Entity has implemented one or more process(es) to revoke the individual's access to the designated storage locations for BES Cyber System Information but, for two individuals, did not do so by the end of the next calendar day following the effective date and time of the termination action. (5.3)	OR The Responsible Entity has implemented one or more process(es) to revoke the individual's access to the designated storage locations for BES Cyber System Information but, for three or more individuals, did not do so by the end of the next calendar day following the effective date and time of the termination action. (5.3)	reassignments or transfers but, for three or more individuals, did not revoke the authorized electronic access to individual accounts and authorized unescorted physical access by the end of the next calendar day following the predetermined date. (5.2)

VRF and VSL Justifications – CIP-004-6, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-004-5.1 R5. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-004-6, R5	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Failure to implement programs for access revocation has a binary Severe VSL. A single lapse in protection of this Requirement does not compromise computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	This requirement does not specify a lower VSL for lack of documentation.

VRF and VSL Justifications – CIP-006-6, R1	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	A VRF of Medium is assigned to this Requirement. The requirement specifies that each Responsible Entity shall implement one or more documented physical security plans for its BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets. Failure to restrict physical access to BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets could result in unauthorized access, which could directly affect the ability to monitor or control the BES.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for one or more documented physical security plans for its BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets. The VRF is only applied at the requirement level and the requirement parts are treated equally. Each requirement part contributes to the reliability objective.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-006-5, R1, which has an approved VRF of Medium; and, therefore, the proposed VRF for CIP-006-6, R1 is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. CIP-006-6, Requirement R1 requires the implementation of documented physical security plans for its BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets. A failure to implement these documented plans may impact the reliability and operability of the BES. Therefore, and according to NERC VRF definitions, this requirement,

VRF and VSL Justifications – CIP-006-6, R1			
	if violated, could directly affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The proposed requirement has a single objective of ensuring that Responsible Entities implement one or more documented physical security plans for its BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems, Physical Access Control Systems and Protected Cyber Assets and, therefore, does not co-mingle more than one obligation.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity did not document or implement physical security plans. (R1) OR The Responsible Entity did not document or implement operational or procedural controls to restrict physical access. (1.1) OR The Responsible Entity has documented and implemented physical access controls, but at least one control does not exist to restrict access to Applicable Systems. (1.2)

VRF and VSL Justifications – CIP-006-6, R1			
			OR The Responsible Entity has documented and implemented physical access controls, but at least two different controls do not exist to restrict access to Applicable Systems. (1.3) OR The Responsible Entity does not have a process to monitor for unauthorized access through a physical access point into a Physical Security Perimeter. (1.4) OR The Responsible Entity does not have a process to alert for detected unauthorized access through a physical access point into a Physical Security Perimeter or to communicate such alerts within 15 minutes to identified personnel. (1.5) OR The Responsible Entity does not have a process to monitor each

VRF and VSL Justifications – CIP-006-6, R1			
			Physical Access Control System for unauthorized physical access to a Physical Access Control Systems. (1.6) OR The Responsible Entity does not have a process to alert for unauthorized physical access to Physical Access Control Systems or to communicate such alerts within 15 minutes to identified personnel. (1.7) OR The Responsible Entity does not have a process to log authorized physical entry into each Physical Security Perimeter with sufficient information to identify the individual and date and time of entry. (1.8) OR The Responsible Entity does not have a process to retain physical access logs for 90 calendar days. (1.9) OR

VRF and VSL Justifications – CIP-006-6, R1			
			The Responsible Entity did not document or implement physical access restrictions, encryption, monitoring or equally effective logical protections for cabling and other nonprogrammable communication components used for connection between applicable Cyber Assets within the same Electronic Security Perimeter in those instances when such cabling and components are located outside of a Physical Security Perimeter. (1.10)

VRF and VSL Justifications – CIP-006-6, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-006-5 R1. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are binary in the "Severe" category and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – CIP-006-6, R1	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The proposed VSL is binary and assigns a "Severe" category for the violation of the Requirement.

VRF and VSL Justifications – CIP-006-6, R1	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for document and implement.

VRF and VSL Justifications – CIP-006-6, R2	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	A VRF of Medium is assigned to this requirement. This Requirement calls for one or more documented visitor control programs. Failure to implement a visitor control program is not expected to directly affect the electrical state or capability of the Bulk Electric System.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for one or more documented visitor control programs. The VRF is only applied at the requirement level and the requirement parts are treated equally. Each requirement part contributes to the reliability objective.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-006-5, R2, which has an approved VRF of Medium; and, therefore, the proposed VRF for CIP-006-6, R2 is consistent.

VRF and VSL Justifications – CIP-006-6, R2			
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to implement a documented visitor control program is an administrative requirement, and is not expected to adversely affect the electrical state or capability of the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The proposed requirement has a single objective of ensuring that Responsible Entities implement one or more documented visitor control programs and, therefore, does not co-mingle more than one obligation.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity has failed to include or implement a visitor control program that requires continuous escorted access of visitors within any Physical Security Perimeter. (2.1) OR The Responsible Entity has failed to include or implement a visitor control program that requires logging of the initial entry and last exit dates and times of the visitor, the visitor's name, and the point of contact. (2.2) OR

VRF and VSL Justifications – CIP-006-6, R2			
			The Responsible Entity failed to include or implement a visitor control program to retain visitor logs for at least ninety days. (2.3)

VRF and VSL Justifications – CIP-006-6, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The VSLs are binary in the “Severe” category and therefore do not lower the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are binary in the “Severe” category and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VRF and VSL Justifications – CIP-006-6, R2	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The proposed VSL is binary and assigns a "Severe" category for the violation of the Requirement.

VRF and VSL Justifications – CIP-006-6, R2	
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for document and implement.

VRF and VSL Justifications – CIP-007-6, R1	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	The Requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and physical I/O ports. Depending on the port and the impact classification of the affected cyber asset, a violation could lead to affecting the monitoring or control of a BES asset.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The VRF is only applied at the Requirement level, and the Requirement Parts are treated equally. Unprotected logical and physical ports are both access points into a BES Cyber System.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-007-5, R1, which has an approved VRF of Medium; therefore, the proposed VRF is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs.

VRF and VSL Justifications – CIP-007-6, R1			
	Failure to disable or prevent access to a single logical or physical port on one BES Cyber System is unlikely to lead to Bulk Electric System instability, separation, or cascading failures. Therefore, this Requirement was assigned a Medium VRF.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. Unprotected logical and physical ports are both access points into a BES Cyber System.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	The Responsible Entity has implemented and documented processes for Ports and Services but had no methods to protect against unnecessary physical input/output ports used for network connectivity, console commands, or removable media. (1.2)	The Responsible Entity has implemented and documented processes for determining necessary Ports and Services but, where technically feasible, had one or more unneeded logical network accessible ports enabled. (1.1)	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R1. (R1)

VRF and VSL Justifications – CIP-007-6, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-007-5 R1. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-007-6, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single violation of this Requirement at the moderate or high VSL category would not necessarily compromise computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a program as a Severe violation while also accounting for the failure to implement the program using a gradation VSL methodology.

VRF and VSL Justifications – CIP-007-6, R2			
Proposed VRF	**MEDIUM**		
NERC VRF Discussion	The Requirement requires entities to manage security patches in a proactive way by monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner. Depending on the patch and the impact classification of the affected Cyber Asset, a violation could lead to affecting the monitoring or control of a BES asset.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The VRF is only applied at the requirement level, and the requirement parts are treated equally. The parts are required parts of a single process.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This Requirement maps from CIP-007-5, R2, which has an approved VRF of Medium. Therefore the VRF is consistent with the FERC-approved VRF.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to manage a security patch on one BES Cyber System is unlikely to lead to BES instability.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The Requirement does not co-mingle more than one obligation. It defines required steps in a single process.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has documented and implemented one or more process(es) to evaluate uninstalled released security patches for applicability but did not	The Responsible Entity has documented or implemented one or more process(es) for patch management but did not include any processes, including the identification of sources, for tracking or	The Responsible Entity has documented or implemented one or more process(es) for patch management but did not include any processes for installing cyber security patches for applicable Cyber Assets. (2.1)	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R2. (R2) OR

VRF and VSL Justifications – CIP-007-6, R2			
evaluate the security patches for applicability within 35 calendar days but less than 50 calendar days of the last evaluation for the source or sources identified. (2.2) OR The Responsible Entity has one or more documented process(es) for evaluating cyber security patches but, in order to mitigate the vulnerabilities exposed by applicable security patches, did not apply the applicable patches, create a dated mitigation plan, or revise an existing mitigation plan within 35 calendar days but less than 50 calendar days of the evaluation completion. (2.3)	evaluating cyber security patches for applicable Cyber Assets. (2.1) OR The Responsible Entity has documented and implemented one or more process(es) to evaluate uninstalled released security patches for applicability but did not evaluate the security patches for applicability within 50 calendar days but less than 65 calendar days of the last evaluation for the source or sources identified. (2.2) OR The Responsible Entity has one or more documented process(es) for evaluating cyber security patches but, in order to mitigate the vulnerabilities exposed by applicable security patches, did not apply the applicable patches, create a dated mitigation plan, or revise an existing mitigation plan	OR The Responsible Entity has documented and implemented one or more process(es) to evaluate uninstalled released security patches for applicability but did not evaluate the security patches for applicability within 65 calendar days of the last evaluation for the source or sources identified. (2.2) OR The Responsible Entity has one or more documented process(es) for evaluating cyber security patches but, in order to mitigate the vulnerabilities exposed by applicable security patches, did not apply the applicable patches, create a dated mitigation plan, or revise an existing mitigation plan within 65 calendar days of the evaluation completion. (2.3)	The Responsible Entity has documented or implemented one or more process(es) for patch management but did not include any processes for tracking, evaluating, or installing cyber security patches for applicable Cyber Assets. (2.1) OR The Responsible Entity documented a mitigation plan for an applicable cyber security patch and documented a revision or extension to the timeframe but did not obtain approval by the CIP Senior Manager or delegate. (2.4) OR The Responsible Entity documented a mitigation plan for an applicable cyber security patch but did not implement the plan as created or revised within the timeframe specified in the plan. (2.4)

VRF and VSL Justifications – CIP-007-6, R2			
	within 50 calendar days but less than 65 calendar days of the evaluation completion. (2.3)		

VRF and VSL Justifications – CIP-007-6, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines— There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but failed to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-007-5 R2. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-007-6, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A violation of this Requirement does not necessarily compromise computer network security. Failure to implement a security patch can increase the vulnerability of the BES Cyber System, but several other required protections would have to concurrently fail for actuating the vulnerability. There may be instances where the security vulnerability is so severe that failure to patch alone can comprise computer network security, but these cases are the exception.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a process as a Severe violation while also accounting for the failure to implement the process using a gradation VSL methodology.

VRF and VSL Justifications – CIP-007-6, R3			
Proposed VRF	**MEDIUM**		
NERC VRF Discussion	The requirement requires entities to have processes to limit and detect the introduction of malicious code onto the components of a BES Cyber System. Depending on the malware and the impact classification of the affected Cyber Asset, a violation could lead to affecting the monitoring or control of a BES asset.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The VRF is only applied at the requirement level, and the Requirement Parts are treated equally. The parts are required parts of a single process.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-007-5, R3, which has an approved VRF of Medium; therefore, the proposed VRF is consistent.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to manage malicious code on one BES Cyber System is unlikely to lead to BES instability.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The requirement does not co-mingle more than one obligation. It defines required steps in a single process.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	The Responsible Entity has implemented one or more documented process(es), but, where signatures or patterns are used, the Responsible Entity did not address testing the signatures or patterns. (3.3)	The Responsible Entity has implemented one or more documented process(es) for malicious code prevention but did not mitigate the threat of detected malicious code. (3.2) OR	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R3. (R3). OR

VRF and VSL Justifications – CIP-007-6, R3			
		The Responsible Entity has implemented one or more documented process(es) for malicious code prevention, but where signatures or patterns are used, the Responsible Entity did not update malicious code protections. (3.3).	The Responsible Entity has implemented one or more documented process(es) for malicious code prevention but did not deploy method(s) to deter, detect, or prevent malicious code. (3.1)

VRF and VSL Justifications – CIP-007-6, R3	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-007-5 R3. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-007-6, R3	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A violation of this Requirement does not necessarily compromise computer network security. Failure to implement malicious code protections can increase the vulnerability of the BES Cyber System, but several other required protections would have to concurrently fail for actuating the vulnerability.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a process as a Severe violation while also accounting for the failure to implement the process using a gradation VSL methodology.

VRF and VSL Justifications – CIP-007-6, R4			
Proposed VRF	**MEDIUM**		
NERC VRF Discussion	The requirement requires entities to have processes to provide security event monitoring with the purpose of detecting unauthorized access, reconnaissance, and other malicious activity on BES Cyber Systems and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the immediate detection of an incident and (2) useful evidence in the investigation of an incident. Depending on the impact classification of the affected Cyber Asset, a violation could lead to affecting the monitoring or control of a BES asset.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The VRF is only applied at the requirement level, and the requirement parts are treated equally. The parts are required parts of a single process.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-007-5, R4, which has an approved VRF of Medium; therefore, the proposed VRF is consistent.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to manage security events on one BES Cyber System is unlikely to lead to BES instability.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The requirement does not co-mingle more than one obligation. It defines required steps in a single process.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has documented and implemented one or more process(es) to identify undetected Cyber	The Responsible Entity has documented and implemented one or more process(es) to identify undetected Cyber	The Responsible Entity has documented and implemented one or more process(es) to generate alerts for necessary security events (as determined by	The Responsible Entity did not implement or document one or more process(es) that included the

VRF and VSL Justifications – CIP-007-6, R4			
Security Incidents by reviewing an entity-determined summarization or sampling of logged events at least every 15 calendar days but missed an interval and completed the review within 22 calendar days of the prior review. (4.4)	Security Incidents by reviewing an entity-determined summarization or sampling of logged events at least every 15 calendar days but missed an interval and completed the review within 30 calendar days of the prior review. (4.4)	the responsible entity) for the Applicable Systems (per device or system capability) but did not generate alerts for all of the required types of events described in 4.2.1 through 4.2.2. (4.2) OR The Responsible Entity has documented and implemented one or more process(es) to log applicable events identified in 4.1 (where technically feasible and except during CIP Exceptional Circumstances) but did not retain applicable event logs for at least the last 90 consecutive days. (4.3) OR The Responsible Entity has documented and implemented one or more process(es) to identify undetected Cyber Security Incidents by reviewing an entity-determined summarization or sampling of logged events at least every 15 calendar days but missed two or more intervals. (4.4)	applicable items in CIP-007-6 Table R4. (R4) OR The Responsible Entity has documented and implemented one or more process(es) to log events for the Applicable Systems (per device or system capability) but did not detect and log all of the required types of events described in 4.1.1 through 4.1.3. (4.1)

VRF and VSL Justifications – CIP-007-6, R4	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-007-5 R4. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated Requirement and are, therefore, consistent with the Requirement.

VRF and VSL Justifications – CIP-007-6, R4	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The Requirement Parts for logging required types of events have a binary Severe VSL. Other Requirement Parts associated with security event monitoring do not indicate a single lapse compromising computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a program as a Severe violation while also accounting for the failure to implement the program using a gradation VSL methodology.

VRF and VSL Justifications – CIP-007-6, R5	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	This Requirement ensures that Responsible Entities establish, implement, and document controls for electronic access to BES Cyber Systems. This includes enforcement of authentication for all user access and CIP Senior Manager, or delegate authorization for use of administrator, shared, default, and other generic account types. It prescribes procedural controls and conditions for changing default passwords and enforcing specific parameters for password based user authentication. Finally, it helps establish a process to limit (where technically feasible) unsuccessful authentication attempts or generating alerts after a threshold of unsuccessful login attempts.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This Requirement calls for specific actions represented by multiple sub-requirements with a common set of objectives – to ensure the appropriate controls are in place for authorizing and establishing secure electronic access to BES Cyber Systems.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This Requirement maps to CIP-007-5, R5, which has an approved VRF of Medium; therefore, the proposed VRF is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to implement CIP Senior Manager oversight and establish controls to protect BES Cyber Systems from unauthorized electronic access could result in unauthorized access and could directly affect the ability to monitor or control the BES. Although the previous standards versions assigned a VRF of Severe, this is not consistent with the projected risk of BES Cyber System exploitation, which is why the VRF has been modified to Medium.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The Requirements in R5 have a common objective to provide controls to protect against unauthorized electronic access to BES Cyber Systems. The Requirements to authorize and review access, and the

VRF and VSL Justifications – CIP-007-6, R5			
	provided technical and procedural controls to prevent unauthorized access both specify the obligations to provide strong controls to monitor and control electronic access.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access but did not technically or procedurally enforce password changes or an obligation to change the password within 15 calendar months but less than or equal to 16 calendar months of the last password change. (5.6)	The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access but did not technically or procedurally enforce password changes or an obligation to change the password within 16 calendar months but less than or equal to 17 calendar months of the last password change. (5.6)	The Responsible Entity has implemented one or more documented process(es) for System Access Controls but, did not include the identification or inventory of all known enabled default or other generic account types, either by system, by groups of systems, by location, or by system type(s). (5.2) OR The Responsible Entity has implemented one or more documented process(es) for System Access Controls but, did not include the identification of the individuals with authorized access to shared accounts. (5.3) OR The Responsible Entity has implemented one or more documented process(es) for password-only authentication for	The Responsible Entity did not implement or document one or more process(es) that included the applicable items in CIP-007-6 Table R5. (R5) OR The Responsible Entity has implemented one or more documented process(es) for System Access Controls but, where technically feasible, does not have a method(s) to enforce authentication of interactive user access. (5.1) OR The Responsible Entity has implemented one or more documented process(es) for System Access Controls but, where technically feasible, does not have a method(s) to enforce

VRF and VSL Justifications – CIP-007-6, R5			
		interactive user access that did not technically or procedurally enforce one of the two password parameters as described in 5.5.1 and 5.5.2. (5.5) OR The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access that did not technically or procedurally enforce one of the two password parameters as described in 5.5.1 and 5.5.2. (5.5) OR The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access but did not technically or procedurally enforce password changes or an obligation to change the password within 17 calendar months but less than or equal to 18 calendar months of the last password change. (5.6)	authentication of interactive user access. (5.1) OR The Responsible Entity has implemented one or more documented process(es) for System Access Controls but did not, per device capability, change known default passwords. (5.4) OR The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access but the Responsible Entity did not technically or procedurally enforce all of the password parameters described in 5.5.1 and 5.5.2. (5.5) OR The Responsible Entity has implemented one or more documented process(es) for password-only authentication for interactive user access but did not

VRF and VSL Justifications – CIP-007-6, R5			
			technically or procedurally enforce password changes or an obligation to change the password within 18 calendar months of the last password change. (5.6) OR The Responsible Entity has implemented one or more documented process(es) for System Access Control but, where technically feasible, did not either limit the number of unsuccessful authentication attempts or generate alerts after a threshold of unsuccessful authentication attempts. (5.7)

VRF and VSL Justifications – CIP-007-6, R5	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-007-5 R5. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-007-6, R5	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations. Gradations are based on the number of unidentified account types, or number of missed controls for authentication and access represent components of the overall requirement that are necessary to fully achieve the reliability of the main requirement.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The Requirement parts that can compromise computer network security have a Severe VSL. Other Requirement Parts associated with system access control do not indicate a single lapse compromising computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for the interdependence of documentation and implementation and treats the failure to document a program as a Severe violation while also accounting for the failure to implement the program using a gradation VSL methodology.

VRF and VSL Justifications – CIP-009-6, R2			
Proposed VRF	**LOWER**		
NERC VRF Discussion	This Requirement's VRF is consistent with similar administrative Requirements with similar risks in other NERC Reliability Standards.		
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A		
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. Each Requirement row contributes to the common objective of implementing and maintaining the recovery plan.		
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This requirement maps from CIP-009-5, R2, which has an approved VRF of Lower.		
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to implement and maintain the recovery plan is an administrative Requirement and is not expected to adversely affect the electrical state or capability of the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. The requirements in R2 have a common objective of implementing and maintaining recovery plans. Requirement Rows 2.1 and 2.3 specify the obligation to implement and test the plan. Requirement Row 2.2 specifies the obligation to maintain backup information used to recover the BES Cyber System.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 15 calendar months, not exceeding 16 calendar months	The Responsible Entity has not tested the recovery plan(s) within 16 calendar months, not exceeding 17 calendar	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 17 calendar months, not exceeding 18 calendar months between tests of the plan. (2.1)	The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.1 within 18 calendar months between tests of the plan. (2.1)

VRF and VSL Justifications – CIP-009-6, R2			
between tests of the plan. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 15 calendar months, not exceeding 16 calendar months between tests. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 36 calendar months, not exceeding 37 calendar months between tests. (2.3)	months between tests of the plan. (2.1) OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 16 calendar months, not exceeding 17 calendar months between tests. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 37 calendar months, not exceeding 38 calendar months between tests. (2.3)	OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 17 calendar months, not exceeding 18 calendar months between tests. (2.2) OR The Responsible Entity has not tested the recovery plan according to R2 Part 2.3 within 38 calendar months, not exceeding 39 calendar months between tests. (2.3)	OR The Responsible Entity has not tested a representative sample of the information used in the recovery of BES Cyber System functionality according to R2 Part 2.2 within 18 calendar months between tests. (2.2) OR The Responsible Entity has not tested the recovery plan(s) according to R2 Part 2.3 within 39 calendar months between tests of the plan. (2.3)

VRF and VSL Justifications – CIP-009-6, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously-approved requirement CIP-009-5 R2. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-009-6, R2	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation, and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A violation of this requirement indicates the recovery plan was not properly tested and may have deficiencies, but a violation cannot immediately compromise computer security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	This Requirement does not specify a lower VSL for lack of documentation.

VRF and VSL Justifications – CIP-010-2, R1	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	A VRF of Medium is assigned to this requirement. The requirement calls for the implementation of one of more documented configuration change management processes. A VRF assignment of Medium is consistent with the medium risk impact of a violation to implement documented processes that are intended to prevent unauthorized modifications to BES Cyber Assets and BES Cyber Systems based on their baseline configuration. The impact of a failure to implement documented configuration change management processes can have a medium impact on the reliability and operability of the BES. Although the requirement is administrative in nature and is a requirement that, if violated, poses the potential to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The requirement calls for the implementation of one of more documented processes in relation to configuration change management. The VRF is only applied at the requirement level and the requirement parts are treated equally. A VRF assignment of Medium is consistent with the medium risk impact of a violation to implement documented processes that are intended to prevent unauthorized modifications to BES Cyber Assets and BES Cyber Systems based on their baseline configuration.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. CIP-010-2, R1 specifies the implementation of documented configuration change management processes in conjunction with CIP-010-2, R2, which specifies the implementation of documented configuration monitoring processes. Both requirements have a medium risk impact of a violation to implement their documented processes and, therefore, have a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. CIP-010-2, Requirement R1 requires the implementation of documented configuration change management processes. A failure to implement these documented processes has medium impact on the

VRF and VSL Justifications – CIP-010-2, R1			
	reliability and operability of the BES. Therefore, and according to NERC VRF definitions, the requirement is a requirement that, if violated, poses the potential to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation. CIP-010-2, Requirement R1 addresses a single objective and has a single VRF.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity has documented and implemented a configuration change management process(es) that includes only four of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only three of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has documented and implemented a configuration change management process(es) that includes only two of the required baseline items listed in 1.1.1 through 1.1.5. (1.1)	The Responsible Entity has not documented or implemented any configuration change management process(es). (R1) OR The Responsible Entity has documented and implemented a configuration change management process(es) that includes only one of the required baseline items listed in 1.1.1 through 1.1.5. (1.1) OR The Responsible Entity does not have a process(es) that requires authorization and documentation of changes that

VRF and VSL Justifications – CIP-010-2, R1			
			deviate from the existing baseline configuration. (1.2) OR The Responsible Entity does not have a process(es) to update baseline configurations within 30 calendar days of completing a change(s) that deviates from the existing baseline configuration.(1.3) OR The Responsible Entity does not have a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration. (1.4.1) OR The Responsible Entity has a process(es) to determine required security controls in CIP-005 and CIP-007 that could be impacted by a change(s) that deviates from the existing baseline configuration but did

VRF and VSL Justifications – CIP-010-2, R1			
			not verify and document that the required controls were not adversely affected following the change. (1.4.2 & 1.4.3) OR The Responsible Entity does not have a process for testing changes in an environment that models the baseline configuration prior to implementing a change that deviates from baseline configuration. (1.5.1) OR The Responsible Entity does not have a process to document the test results and, if using a test environment, document the differences between the test and production environments. (1.5.2)

VRF and VSL Justifications – CIP-010-2, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-010-1 R1. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-010-2, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	A single lapse in protection is not expected to compromise computer network security.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	CIP-010-2, Requirement R1 specifies that a Responsible Entity must implement and document the processes for configuration change management of BES Cyber Assets and BES Cyber Systems. Documentation of these processes is required, but this documentation is not the primary objective of the requirement. Documentation is interdependent with the implementation of the processes in this case. As such, the VSL measures distance from compliance in terms of whether or not the Responsible Entity "addressed" all the required elements of the configuration change management process. The drafting team's intent is that this covers both documentation and implementation and, therefore, accounts for the interdependence of these tasks.

VRF and VSL Justifications – CIP-010-2, R2	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	A VRF of Medium is assigned to this requirement. The requirement calls for the implementation of one of more documented configuration monitoring processes. A VRF assignment of Medium is consistent with the lower risk impact of a violation to implement documented processes that are intended to prevent unauthorized modifications to BES Cyber Assets and BES Cyber Systems based on their baseline configuration. The impact of a failure to implement documented configuration monitoring processes has medium impact on the reliability and operability of the BES.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. The requirement calls for the implementation of one of more documented processes in relation to configuration monitoring. The VRF is only applied at the requirement level and the requirement parts are treated equally. A VRF assignment of Medium is consistent with the medium risk impact of a violation to implement documented processes that are intended to prevent unauthorized modifications to BES Cyber Assets and BES Cyber Systems based on their baseline configuration.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. CIP-010-2, R2 specifies the implementation of documented configuration monitoring processes in conjunction with CIP-010-2, R1, which specifies the implementation of documented configuration change management processes. Both requirements have a medium risk impact of a violation to implement their documented processes and, therefore, have a Medium VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. CIP-010-2, Requirement R2 requires the implementation of documented configuration monitoring processes. A failure to implement these documented processes has medium impact on the reliability and operability of the BES.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation.

VRF and VSL Justifications – CIP-010-2, R2			
	CIP-010-1, Requirement R2 addresses a single objective and has a single VRF.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity has not documented or implemented a process(es) to monitor for, investigate, and document detected unauthorized changes to the baseline at least once every 35 calendar days. (2.1)

VRF and VSL Justifications – CIP-010-2, R2	
NERC VSL Guidelines	Meets NERC's VSL Guidelines — Severe: the performance measured does not substantively meet the intent of the Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-010-1 R2. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSL is binary and assigns a "Severe" category for the violation of the Requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated Requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-010-2, R2	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The VSL is binary.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	CIP-010-2, Requirement R2 specifies that a Responsible Entity must implement and document the processes for configuration monitoring of BES Cyber Assets and BES Cyber Systems. Documentation of these processes is required, but this documentation is not the primary objective of the requirement. Documentation is interdependent with the implementation of the processes in this case. As such, the VSL measures distance from compliance in terms of whether or not the Responsible Entity "addressed" all the required elements of the configuration monitoring process. The drafting team's intent is that this covers both documentation and implementation and, therefore, accounts for the interdependence of these tasks.

VRF and VSL Justifications – CIP-011-2, R1	
Proposed VRF	**MEDIUM**
NERC VRF Discussion	This Requirement ensures that Responsible Entities prevent unauthorized access to BES Cyber System Information. Failure to adequately identify, protect, and control access to such information could result in unauthorized access and lost, stolen, or misused Cyber System Information. Such failure represents a risk to the Bulk Electric System.
FERC VRF G1 Discussion	Guideline 1- Consistency with Blackout Report. N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard. This requirement calls for methods to identify, provide secure handling, and control access to Cyber System Information. The VRF is only applied at the requirement level and the requirement parts are treated equally. The identification, secure handling and control of access have the common objective to protect BES Cyber System Information.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards. This Requirement maps to CIP-003, R4 and CIP-003-3, R4.1, which have an approved VRF of Medium. The Requirement also maps to CIP-003-3, R4.2 and CIP-003-3, R4.3 and to CIP-003-3, R5, CIP-003-3, R5.1, CIP-003-3, R5.2, and CIP-003-3, R5.3, which have an approved VRF of Lower. The requirement has the object of securing Cyber System Information. Version 5 combines requirements to ensure consistency. The proposed VRF is consistent with the approved VRF.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs. Failure to adequately identify and protect BES Cyber System Information could result in disclosure of information to unauthorized persons, lost, stolen, or misused Cyber System Information. Such breaches of confidentiality represent a risk to the reliability of Bulk Electric System from misuse by unauthorized persons.
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation.

VRF and VSL Justifications – CIP-011-2, R1			
	The sub requirements in R1 have a common objective to assure confidentiality of BES Cyber System Information. The obligations to identify, control access, and assure proper handling of BES Cyber System Information contribute to this objective and only one VRF is assigned.		
Proposed VSLs			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity has not documented or implemented a BES Cyber System Information protection program (R1).

VRF and VSL Justifications – CIP-011-2, R1	
NERC VSL Guidelines	Meets NERC's VSL Guidelines—There is an incremental aspect to a violation of this requirement and the VSLs follow the guidelines for incremental violations. Some measurable reliability benefit can be achieved if the Responsible Entity documented cyber security policies but fails to address one or more of the required elements of the cyber security policy. The drafting team has, therefore, decided that gradated performance VSLs are appropriate for this Requirement.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement maps to the previously-approved requirement CIP-011-1 R1. The proposed VSLs removed the "identify, assess, and correct" concept but retained the same level of compliance for the requirements. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.

VRF and VSL Justifications – CIP-011-2, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSLs are based on a single violation and not cumulative violations.
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	The VSLs are binary for this requirement.
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	The VSLs account for document and implement.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Final Ballots Now Open through November 6, 2014

Now Available

Final ballots for **Critical Infrastructure Protection Standards Version 5 Revisions** are open through **8 p.m. Eastern Thursday, November 6, 2014.**

The final ballots are as follows:

- CIP-003-6 - Cyber Security — Security Management Controls
- CIP-004-6 - Cyber Security — Personnel & Training
- CIP-006-6 - Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-6 - Cyber Security — Systems Security Management
- CIP-009-6 - Cyber Security — Recovery Plans for BES Cyber Systems
- CIP-010-2 - Cyber Security — Configuration Change Management and Vulnerability Assessments
- CIP-011-2 - Cyber Security — Information Protection
- Implementation Plan

Background information for this project can be found on the project page.

Please note that the standards and implementation plan balloted as Version X during the additional ballot are the standards and implementation plan being posted for final ballot. The standards balloted as CIP-003-6 and CIP-010-2 during the additional ballot are undergoing further revisions by the standard drafting team. Therefore, the CIP-003-6 and CIP-010-2 presented for final ballot at this time contain different revisions than the CIP-003-6 and CIP-010-2 presented for additional ballot. NERC added the version numbers to the Version X standards for final ballot in order to prepare them for presentation to the NERC Board of Trustees.

CIP-006-6 and CIP-009-6 are also being posted for final ballot but were not included in the Version X ballot. The votes for CIP-006-6 and CIP-009-6 will be pulled from the initial ballot of those standards. Therefore, you do not have to recast your vote for those standards if your vote remains unchanged from initial ballot.

Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a vote during the last ballot window may cast a vote in the final ballot window. If a ballot pool member

cast a vote in the previous ballot and does not participate in the final ballot, that member's vote will be carried over in the final ballot.

Members of the ballot pools associated with this project may log in and submit their votes for the standards and implementation plan by clicking here.

Next Steps

The voting results for the standards and implementation plan will be posted and announced after the ballot window closes. If approved, the standards and implementation plan will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities**.**

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact Ryan Stewart, Manager of Standards Development, or Marisa Hecht, Standards Developer, or at 202-644-8091 or 404-446-9620.

Standards Announcement

Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions

Final Ballot Results

Now Available

Final ballots for **Critical Infrastructure Protection Standards Version 5 Revisions** and one implementation plan concluded at **8 p.m. Eastern, Thursday, November 6, 2014**.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results for the ballots.

Ballot	Quorum /Approval
CIP-003-6	87.56% / 83.84%
CIP-004-6	87.32% / 95.34%
CIP-006-6	87.07% / 86.00%
CIP-007-6	87.56% / 95.35%
CIP-009-6	87.56% / 91.17%
CIP-010-2	87.80% / 83.88%
CIP-011-2	87.56% / 95.40%
Implementation Plan	86.59% / 92.76%

Background information for this project can be found on the project page.

Next Steps

The standards will be submitted to the Board of Trustees for adoption.

For more information on the **Standards Development Process**, please refer to the Standard Processes Manual.

For more information or assistance, please contact either Marisa Hecht (404-446-9620) or Ryan Stewart (202-644-8091).

Standard Drafting Team Roster

Project 2014-02 Standard Drafting Team Roster

Name and Title	Company and Address	Contact Info	Bio
Maggy Powell, NERC Compliance Management	Exelon Corporation 100 Constellation Way, Suite 500P Baltimore, MD 21202	Margaret.Powell@constellation.com (410)470-3382	Maggy Powell has more than twenty years of regulatory risk and government affairs experience covering a broad range of industries including energy, environmental markets, healthcare, scientific research, higher education, and international trade. Ms. Powell currently works in the NERC Compliance Management Team at Exelon Corp. and is responsible for corporate-wide engagement on reliability regulatory matters including development of strategic positions on NERC governance and policy; coordination of technical input on proposed Reliability Standards; promotion of cross-enterprise collaboration; and, resolution of conflicts as appropriate. Exelon is a public utility holding company that, through its utility subsidiaries, distributes electricity to approximately 6.6 million customers in Illinois, Pennsylvania, and Maryland. Exelon has a diverse portfolio of electric generation capacity, and it operates the largest nuclear fleet in the United States. Exelon's operations also include power marketing, transmission, and distribution. At present, Ms. Powell is Co-Chair of the NERC Project 2014-02 CIP Standards V5 Revisions Standards Drafting Team.
Philip Huff Director of IT Security and Compliance	Arkansas Electric Cooperative Corporation 1 Cooperative Way Little Rock, AR 72119	(501)570-2444 philip.huff@aecc.com	Philip Huff serves as the Director of Security and Compliance at Arkansas Electric Cooperative where Mr. Huff has worked the past 12 years. Mr. Huff has served as vice chair of the CIP Version 5 Standards Drafting Team and co-chair of the Version 5 Revisions Standards Drafting Team. Mr. Huff has degrees in Mathematics and Computer Science from Harding University and a Masters in Computer Security from James Madison University. Mr. Huff is a CISSP and holds Department of Defense certifications in information system security.

Project 2014-02 Standard Drafting Team Roster

Jay Cribb, Generation Cyber Security Program Manager	Southern Company Services, Inc. 241 Ralph McGill Blvd NE Atlanta, GA 30308	(404)506-3854 jscribb@southernco.com	Jay Cribb has 29 years' experience in the utility industry with Southern Co. All of Mr. Cribb tenure has been spent in areas related to information technology, and he has spent the last 12 years in cyber security roles. Mr. Cribb was a member of the Order 706 SDT working to produce versions 2-5 of the CIP standards and has spent 5 of the last 6 years on CIP drafting teams. Mr. Cribb is a past chair of the EEI Security Committee and remains active in NERC CIPC, SERC CIPC, EEI, NAGF, and other industry organizations devoted to protecting critical infrastructure.
David S. Revill Manager, Cyber Security Operations	Georgia Transmission Corporation 2100 East Exchange Place Tucker, GA 30084	(770)270-7815 david.revill@gatrans.com	David Revill is the Manager of Cyber Security Operations for Georgia Transmission Corporation (GTC), an electric transmission cooperative owned by 38 of Georgia's Electric Membership Cooperatives. Mr. Revill is responsible for the physical and cyber security of GTC's infrastructure including compliance with all NERC CIP Standards. Mr. Revill previously was the Group Lead for the Electronic Maintenance lab at GTC which was responsible for the SCADA, Revenue Metering, and Communications at GTC's field assets. Prior to joining GTC, Mr. Revill held positions supporting SCADA/EMS systems for control centers as a SCADA Systems Support Engineer and a Process Controls Network Engineer with Entergy. Mr. Revill is the vice-chair of the North American Transmission Forum Security Practices Group. Mr. Revill is also a member of the NERC Critical Infrastructure Protection Committee (CIPC) Executive Committee representing NRECA, the SERC CIPC, the Electricity Subsector Coordinating Council Senior Executive Working Group, and has been a member of the NERC CIP Standards Drafting Team beginning with version 2 of the CIP Standards.

Project 2014-02 Standard Drafting Team Roster

			Mr. Revill holds a Master's degree in Electrical and Computer Engineering from Georgia Tech and dual bachelor's degrees in Electrical Engineering and Computer Engineering from the Tulane University. Mr. Revill is also currently pursuing an MBA at the University of Florida.
Christine Hasha, CIP Compliance Lead Advisor	Electric Reliability Council of Texas, Inc. 2705 W. Lake Dr. Taylor TX 76574	(512)248-3909 chasha@ercot.com	Christine Hasha brings over 20 years' experience in Information Technology with an emphasis on Information Security and regulatory compliance. Ms. Hasha has a CISSP, and holds a degree in Management from St. Edward's University. Ms. Hasha has extensive experience in development of security policies and controls. Ms. Hasha brings experience and training in common control frameworks including previous experience in implementing security controls for banking, Sarbanes-Oxley, GLBA, and HIPAA consistent with IS027001/27002. Ms. Hasha was a member of Project 2008-06 Standards Drafting Team. Ms. Hasha is actively involved with the ERCOT Region CIP Working Group and participates on CIP-related issues for the ISO/RTO Council Standards Review Committee.
David Dockery, Outside Services, NERC Reliability Compliance	Associated Electric Cooperative, Inc. 2814 S Bothwell Ave. Springfield, MO 65804	(417)885-9286 ddockery@aeci.org	David Dockery has thirty years' experience in SCADA/EMS specification, development, modifications, maintenance, and management, including change-management, and later including NERC CIP compliance. Mr. Dockery spent two years as an Ops Engineer and compliance SME for computer systems and Operations related to BA, TOP, GOP, and TSP functions. Mr. Dockery has two years' experience in AECI Compliance Department, for NERC Standards. Former member: MOD-A Standards Drafting Team, and NERC CIP Interpretation Drafting Team. Active Observer for entire CIP Version 5 development process. Active

Project 2014-02 Standard Drafting Team Roster

			Observer for BES Definition Phase-2 development process.
Scott Saunders, Information Security Officer	Sacramento Municipal Utility District 6201 S Street, MS B251 Sacramento, CA 95817	(916)732-5292 scott.saunders@smud.org	Scott Saunders has over 20 years of experience in various information technology disciplines. Mr. Saunders joined the Sacramento Municipal Utility District, an electric utility company in Sacramento, California, in 2007 as the Information Security Officer. Mr. Saunders provides day-to-day leadership, management, and oversight in the implementation of the Critical Infrastructure Protection cybersecurity standards, cybersecurity risk management practices, operational resiliency, and legislative initiatives. Mr. Saunders has contributed in the development of several public-private partnership cybersecurity guidelines; including the Department of Energy (DOE) Risk Management Process (RMP), Electricity Subsector Cybersecurity Capability Maturity Model (ES-C2M2) and the implementation of the Presidential Executive Order 13636: Improving Critical Infrastructure Cybersecurity. Mr. Saunders is the Vice Chair of the National Institute of Standards and Technology (NIST) and Smart Grid Interoperability Panel (SGIP) Smart Grid Cybersecurity Committee (SGCC) representing the electricity sub-sector. Mr. Saunders is a regular guest panelist nationally on cybersecurity and its impacts to municipal utilities. Mr. Saunders maintains several industry certifications, including the Certified Information Systems Security Professional (CISSP) and Certified Information Security Manager (CISM). Mr. Saunders holds both a Bachelor's and Master's of Science in Information Security Assurance.
Forrest Krigbaum, Grid Operations – Information System Security Manager	Bonneville Power Administration 905 NE 11th Ave. Portland, OR 97232	(360)418-2081 fmkrigbaum@bpa.gov	Forrest Krigbaum has over 26 years of progressively responsible experience working on Information Technology and Cyber Security in the Electric Industry. Mr. Krigbaum currently functions as the Transmission Information Security

Project 2014-02 Standard Drafting Team Roster

			programmatic authority and NERC CIP senior manager delegate, responsible for the development and implementation of operational cyber security strategies, policies, processes, guidelines, and projects to safeguard critical cyber assets that are necessary for reliable and secure operation of the Bulk Electric System (BES). Among his significant previous positions, Mr. Krigbaum served as the Compliance Business Partner for the entire BPA organization, by acting as internal auditor on Critical Infrastructure Protection and 693 standards. Mr. Krigbaum provided expert evaluation of BPA evidence for Reliability Standards to ensure agency compliance. Mr. Krigbaum has also served as a BPA Corporate Cyber Security Professional where he managed security risk assessment and reporting activities.
Steven A. Brain, Program Manager ITRM Compliance	Dominion Resources Services, Inc. 707 East Main Street Richmond, VA 23219	(804)771-3987 steve.brain@dom.com	Steven Brain is a Program Manager with Dominion, one the nation's largest producers and transporters of energy. Mr. Brain currently manages the NERC CIP Compliance Program where he is responsible for Critical Infrastructure Protection cybersecurity policy, compliance, and regulatory programs. Mr. Brain is currently a member of the NERC Project 2014-02 CIP Standards V5 Revisions Standards Drafting Team. Mr. Brain has participated in the SERC ISME program where he served as an industry subject matter expert assisting SERC staff during an onsite compliance audit of a large utility in 2012. Mr. Brain has held numerous management roles supporting Dominion's Cyber Security and Compliance programs. These include the following: • Manager –IT DVP Cyber Security & Compliance where he developed the concept and implemented Dominion Virginia Power's cyber security and compliance program.

Project 2014-02 Standard Drafting Team Roster

			• Manager – IT Process Systems where Mr. Brain was responsible for the IT group supporting the Energy Management System used by Electric Transmission's Systems Operations Center. In this role, Mr. Brain enhanced the existing EMS Cyber Security and Compliance program by implementing controls and self-audit techniques. • Manager – IT Risk Operations, where Mr. Brain managed a team of cyber security professionals responsible for operational support of security activities. Prior to Mr. Brain's management responsibilities he held various analyst roles supporting security, network, and telecommunications infrastructure within Dominion's enterprise. In the focus area of security, Mr. Brain conducted audits and performed penetration testing of critical systems using open source and custom scripted tools. Mr. Brain has been instrumental in developing and implementing numerous network security solutions, processes, and procedures currently in use by Dominion. Mr. Brain has over 29 years' experience working in the Utility industry with a concentration on Telecommunications, Information Technology, Cyber Security, and Compliance.
Greg Goodrich, Principal, Security and Compliance Coordination	New York Independent System Operator 10 Krey Boulevard Rensselaer, New York 12144	(518)356-7591 ggoodrich@nyiso.com	Greg Goodrich is the New York Independent System Operator (NYISO) Principal, Security and Compliance Coordination. Mr. Goodrich has over 29 years of experience working with industrial control systems (ICS), supervisory control systems and data acquisition systems (SCADA), energy management systems (EMS), security, and information technology and software. Currently, Mr. Goodrich chairs the NPCC Task Force on Information Security and Technology and serves as a NERC

Project 2014-02 Standard Drafting Team Roster

			Critical Infrastructure Protection Committee (CIPC) representative. Mr. Goodrich is also a member of the ISO/RTO Council (IRC) Security Working Group, which supports cyber security, physical security, and compliance matters. Most recently, Mr. Goodrich is participating as a member of the NERC Project 2014-02 Critical Infrastructure Protection Standards Version 5 Revisions Standard Drafting Team. Mr. Goodrich is participating on the Electricity Sub-sector Coordinating Council Senior Executive Work Group, which supports activities following the Executive Order (EO 13636) and Presidential Policy Directive 21 (PPD-21), including the Integrated Task Force and the update to the National Infrastructure Protection Plan. Additionally, Mr. Goodrich coordinated the New York State Cybersecurity Exercise 2014 partnering with Department of Energy engaging electric and gas companies in New York State evaluating Cybersecurity responses with local, State and Federal partners. Mr. Goodrich joined the NYISO in 2001, where he supported and lead aspects of the Standard Market Design II (SMD-II) project and DOE Smart Grid Investment Grant project, managed Enterprise Security, and coordinated NYISO's NERC CIP compliance program. Prior to joining the NYISO, Mr. Goodrich worked for Vermont Electric Power Company for 12 years managing IT and SCADA/EMS groups. Mr. Goodrich holds several industry and security certifications including the Certified Information System Security Profession (CISSP).

Application of Risk-Based Compliance Mentoring and Enforcement Program Concepts to CIP Version 5

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

The Application of Risk-based Compliance Monitoring and Enforcement Program Concepts to CIP Version 5

October 22, 2014

The purpose of this document is to demonstrate how NERC's Compliance Monitoring and Enforcement Program (CMEP) will apply risk-based concepts to the compliance monitoring and enforcement of Critical Infrastructure Protection Reliability Standards Version 5 (CIP Version 5). NERC will not set forth an independent, separate compliance monitoring and enforcement program for CIP Version 5. Rather, this document provides guidance as industry transitions to CIP Version 5. Additional information regarding Reliability Assurance Initiative (RAI) projects and programs for risk-based compliance monitoring and enforcement may be found in the standalone program documents, which are referenced herein and are available on NERC's RAI webpage.[1]

Introduction

CIP Version 5 represents a significant improvement – and change – over the currently-effective CIP Version 3, as it adopts new cyber security controls and extends the scope of systems that are protected by the CIP Reliability Standards. On November 22, 2013, FERC issued a final rule approving CIP Version 5. Under the FERC-approved implementation plan, registered entities will transition from compliance with currently-effective CIP Version 3 to CIP Version 5, thereby bypassing implementation of CIP Version 4.

In drafting CIP Version 5, the standards drafting team recognized the need to shift from the "zero tolerance" compliance and enforcement approach of the past with respect to several CIP requirements. This was for two reasons. First, while registered entities must identify, control, and minimize noncompliance, it is not reasonable to expect that registered entities will be able to prevent all noncompliance because of the breadth and high frequency of the cybersecurity obligations. Second, individual instances of noncompliance with these requirements in particular are less likely to pose a more-than-minimal risk to reliability. The standards drafting team recognized that, under these circumstances, the enforcement process would better promote the goals of reliability by focusing efforts and resources on avoiding noncompliance that poses a greater risk to reliability. Using an "identify, assess, and correct" approach, specific language in 17 CIP Version 5 requirements would have required registered entities to implement processes, plans, or procedures in a manner that would "identify, assess, and correct" instances of noncompliance. This approach would have required registered entities to develop internal controls and would have enabled noncompliance posing a minimal risk to reliability to be addressed outside of the enforcement process.

In Order No. 791, FERC directed NERC to develop modifications to the CIP Version 5 Standards. Among those modifications, FERC directed NERC to modify the "identify, assess, and correct" language in the 17

[1] http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx.

CIP Version 5 requirements that contained it. While expressing its receptivity to other options, FERC indicated its preference that NERC remove the "identify, assess, and correct" language from the body of the standards, and further indicated its preference not to include compliance language in the standards requirements. In lieu of replacing the "identify, assess, and correct" language, FERC suggested that NERC develop a compliance and enforcement approach, through the CMEP, that would empower NERC and the Regional Entities to exercise risk-based enforcement discretion.

The Way Forward: the Reliability Assurance Initiative

In November 2012, the ERO Enterprise launched a multi-year effort, known as RAI, to identify and implement changes to enhance the effectiveness of the CMEP by using a risk-based approach. A risk-based approach is necessary for a proper allocation of ERO Enterprise resources, enables a process that focuses on improved reliability, and encourages registered entities to enhance internal controls, including those regarding the self-identification of noncompliance.

Further, the ERO Enterprise recognized that it is not practical, effective, or sustainable to monitor and treat all compliance issues to the same degree or in the same manner. Compliance monitoring and enforcement must be "right-sized" based on a number of considerations, including risk factors and registered entity management practices related to the detection, assessment, mitigation, and reporting of noncompliance.

In response to Order No. 791, the ERO determined that it would be useful to explain how the compliance monitoring and enforcement of CIP Version 5 will necessarily be shaped by risk-based CMEP concepts. The risk-based CMEP approach incorporates the fundamental rationale and principles of the self-correcting "identify, assess, and correct" language and applies it to all Reliability Standards. This approach:

- Recognizes that not all noncompliance requires formal enforcement action;
- Recognizes and rewards registered entities for efforts to improve internal controls and methods for the prompt self-identification and mitigation of noncompliance;
- Maintains ERO Enterprise visibility into all noncompliance to identify reliability risks and trends; and
- Maintains NERC oversight to identify implementation issues and opportunities for improvement.

The ERO Enterprise is well on its way to implementing the risk-based CMEP approach. Over the course of 2013-2014, the ERO Enterprise tested a number of concepts, processes, and programs for complete implementation in 2015. The ERO Enterprise is gaining experience – now – applying risk-based enforcement concepts to noncompliance with CIP Reliability Standards. For example, a substantial portion of the compliance exceptions that have been processed as part of the limited rollout of that program have resolved instances of noncompliance with CIP Reliability Standards. Beginning in 2015, the ERO Enterprise will consider all minimal risk noncompliance from all registered entities to be eligible for compliance exception treatment.

The risk-based CMEP concepts are discussed below.

Compliance Monitoring of CIP Version 5

The transformation for compliance monitoring involves the use of the oversight plan framework (Framework).[2] The Framework focuses on identifying, prioritizing, and addressing risks to the bulk power system (BPS), which enable each Regional Entity to allocate resources where they are most needed and likely to be the most effective. The result is a compliance oversight plan for each individual registered entity.

The ERO Enterprise's migration to a risk-based strategy for compliance monitoring includes a significant focus on cybersecurity and the CIP Version 5 Reliability Standards. The inherent risk assessment and internal control evaluation will be essential components for the monitoring of compliance with CIP Version 5.

Inherent Risk Assessment (IRA)

The Regional Entities conduct IRAs for the registered entities within their regions. An IRA is a review of potential risks posed by an individual registered entity to the reliability of the BPS. An IRA considers factors such as assets, systems, geography, interconnectivity, and functions performed, among others. The IRA enables the Regional Entities to tailor oversight appropriately. For example, a Regional Entity may choose not to include in the scope of its monitoring activities certain standards or requirements if the IRA shows less risk to reliability for those standards or requirements for that registered entity. Conversely, a Regional Entity may choose to focus its monitoring on areas for which the IRA shows greater risk.

CIP Version 5 was designed to apply security controls to those systems and processes that could cause the most significant impact to the grid. Therefore, in conducting the IRA for a Responsible Entity under CIP Version 5, the Regional Entity would consider, among other things, the Bulk Electric System (BES) Cyber System Categorization analysis developed pursuant to CIP-002-5.1 R1. This standard provides "bright-line" criteria for registered entities to categorize their BES Cyber Systems based on the impact of their associated Facilities, systems, and equipment, which, if destroyed, degraded, misused, or otherwise rendered unavailable, would affect reliable BES operation.

By understanding the entity's high, medium, and low impact BES Cyber Systems, the Regional Entities are able to tailor the compliance monitoring to the entity's risk and identify which systems in each category should be the focus of compliance monitoring activities.

Internal Control Evaluation (ICE)

Following the IRA, a registered entity may elect to provide information concerning the internal controls it uses to manage reliability risks to help focus the compliance oversight efforts of the Regional Entity. The process by which this evaluation takes place is called the ICE. The ICE is a voluntary process, and registered entities are not obligated to participate. However, the evaluation of internal controls may be

[2] *See, e.g.*, Overview of the ERO Enterprise's Risk-Based Compliance Monitoring and Enforcement Program (Sep. 5, 2014), *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Overview%20of%20the%20ERO%20Enterprise's%20Risk-Based%20CMEP.pdf. *See also* 2015 ERO Compliance Monitoring and Enforcement Implementation Plan (Sep. 8, 2014), *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Final_2015%20CMEP%20IP_V7_090814.pdf.

especially useful for tailoring compliance monitoring activities in the CIP context, as CIP Version 5 requires system or device level controls on hundreds of facilities that may operate thousands of devices.

As described in the ERO Enterprise Internal Control Evaluation Guide (ICE Guide),[3] the ICE may inform whether a registered entity has implemented effective internal controls that provide reasonable assurance of compliance with Reliability Standards associated with areas of risk identified through the IRA. The Regional Entity uses the IRA to identify the risks applicable to the registered entity and uses the ICE to understand how the registered entity manages or mitigates those risks to further tailor monitoring activities. The ICE is designed to be scalable, recognizing that the make-up of an internal control program will vary in accordance with the registered entity's size and complexity.

Monitoring Tools

Ultimately, the Regional Entity will determine the type and frequency of the compliance monitoring tools (i.e., off-site or on-site audits, spot checks, or self-certifications) warranted for a particular registered entity based on reliability risks, as determined through the IRA and, if applicable, ICE processes. The Regional Entity may conduct more resource-intensive compliance monitoring activities with respect to functions or registered entities within its region that can have the most significant impact on reliability of the BPS, as determined through the IRA. For functional roles or registered entities that have a lesser impact on reliability to the BPS, the Regional Entity may tailor compliance monitoring approaches accordingly.

Example of Risk-Based Compliance Monitoring Approach to CIP Version 5

This example will refer to hypothetical entity called "ABC Co."

The Regional Entity performs an IRA for ABC Co., which is located within its region. As determined through the CIP-002-5.1 analysis, ABC Co. has numerous high and medium impact BES Cyber Systems. The Regional Entity considers ABC Co.'s geography, interconnectivity, and functions performed. From this assessment, the Regional Entity determines that workforce capability issues at ABC Co. could pose greater risk to reliability.

Therefore, as a result of its IRA, the Regional Entity proposes to include Reliability Standards that address the security of networks, Supervisory Control and Data Acquisition/Energy Management Systems (SCADA/EMS), and the personnel that support them. As part of its compliance oversight plan for ABC Co., the Regional Entity determines to place special emphasis on the following Reliability Standards for its next Compliance Audit of ABC Co.: CIP-002, CIP-004, CIP-005, and CIP-007.

ABC Co. is confident that its internal controls relating to its networks, SCADA/EMS, and personnel are well-designed and effective. ABC Co. agrees to participate in an ICE. As part of this ICE, ABC Co. provides documentation regarding the following to the Regional Entity:

- Management philosophy and communication in support of its internal compliance program;
- Evidence of yearly compliance assessments performed by independent firms; and

[3] The ERO Enterprise Internal Control Evaluation Guide (Oct. 2014) (ICE Guide), *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/ERO%20Enterprise%20Internal%20Control%20Evaluation%20Guide.pdf.

- Internal Audit Division with department goals and measures to ensure compliance with Reliability Standards.

The Regional Entity follows the process set forth in the ICE Guide to identify which of the internal controls provided by ABC Co. are considered "key" in support of the Reliability Standards in scope as part of the compliance oversight plan and should be tested. For example, the Regional Entity may review the following information and validating measures relating to internal controls for CIP-005 R1:[4]

- Electronic Security Perimeter diagrams indicating access points to applicable systems connected to a network via a routable protocol;
- Electronic Access Point network configurations, access lists, or firewall rules;
- The results of annual vulnerability assessments to identify points of access to BES Cyber Systems.

The Regional Entity then begins the process of evaluating the selected key controls in accordance with the methods set forth in the ICE Guide. With the key controls selected for testing, the Regional Entity has the information available to make decisions about the effectiveness of ABC Co.'s internal controls for the in-scope standards and more importantly, the effectiveness of the overall internal control program and whether it provides reasonable assurance of compliance.

In light of the information obtained through the IRA and ICE processes, the Regional Entity decides to define the following compliance monitoring plan for ABC Co.:

- Tri-annual Compliance Audit: ABC Co.'s tri-annual audit would be based primarily on the Reliability Standards identified by the IRA (CIP-002, CIP-004, CIP-005, and CIP-007), with limited reviews and testing of other Reliability Standards. Depending on the results of the ICE, the Regional Entity may adjust the amount of testing to be performed during the audit.
- Guided Self-Certifications: ABC Co. would demonstrate compliance with other applicable Reliability Standards by providing compliance information or evidence of controls through a Self-Certification program customized to ABC Co.'s IRA and ICE results.
- Regular Tests of Key Controls: The Regional Entity would assess any changes to ABC Co.'s internal control program to ensure overall program effectiveness.

Enforcement of Noncompliance for CIP Version 5

Over the past several years, the ERO Enterprise has been migrating to a risk-based strategy of assessing and processing noncompliance. Initially, each instance of noncompliance with the CIP Reliability Standards became a Possible Violation filed in a Notice of Penalty. By introducing the Find, Fix, Track and Report (FFT) process in 2011, the ERO Enterprise recognized that not all violations required the imposition of monetary penalties. The FFT process has successfully resolved over 2,000 instances of noncompliance with the Reliability Standards outside of a Notice of Penalty. Most of these FFTs posed a minimal risk to the reliability of the BPS, and 55% of them involved noncompliance with CIP Reliability Standards.

[4] The list of controls and measures provided here is for illustrative purposes only and should not be interpreted as an exhaustive or complete list of possible controls or an indication of which key controls a Regional Entity may choose to test or find acceptable in a specific case. Registered entities should consult the ICE Guide for further information regarding the ICE process.

Building on its experience with a streamlined process and a reduced record, the ERO Enterprise is implementing two major programs that were developed under RAI to continue the shift toward a risk-based model of enforcement. These programs mark the continued migration away from a "zero tolerance" approach, where all instances of noncompliance are evaluated as Possible Violations. These programs leverage existing internal practices at registered entities relating to self-monitoring, identification, assessment, and correction of noncompliance with Reliability Standards. By appropriately valuing and rewarding such efforts (i.e., by providing a disposition path outside of a formal enforcement action), the ERO Enterprise encourages the enhancement of internal controls and self-identification of noncompliance throughout the industry. These programs include the expansion of risk-based enforcement discretion (compliance exceptions) and the self-logging program.

These risk-based programs embody many of the same risk-based concepts of the "identify, assess, and correct" approach. However, these approaches apply to all Reliability Standards and requirements, not just the 17 CIP Version 5 requirements containing the "identify, assess, and correct" language.

Compliance Exceptions

Since 2013, the ERO Enterprise has exercised discretion when deciding whether to initiate an enforcement action for noncompliance posing a minimal risk to the reliability of the BPS. Issues resolved outside of an enforcement action are referred to as **compliance exceptions.**

Compliance exceptions reflect the "identify, assess, and correct" tenet that not all noncompliance requires processing in a formal enforcement action. Compliance exception treatment is especially appropriate if the registered entity adequately identifies its noncompliance, assesses the risk properly as minimal risk, and corrects (i.e. mitigates) the noncompliance in a timely and appropriate manner. A robust internal compliance program and management practices that led to timely discovery and timely mitigation of noncompliance would create a strong argument in favor of compliance exception treatment. However, all minimal risk noncompliance is eligible regardless of discovery method.

Compliance exceptions are similar to FFT remediated issues in that they will not incur any financial penalty. However, compliance exceptions differ from FFT remediated issues in several important ways. First, compliance exceptions are not subject to formal enforcement processes. Further, a compliance exception is part of a registered entity's compliance history only to the extent that it serves to inform the ERO Enterprise of potential risk. Compliance exceptions are not part of a registered entity's violation history for purposes of aggravation of penalties. Finally, to maintain visibility and allow for appropriate oversight, all compliance exceptions will be documented, submitted to NERC for review, and reported to FERC.

Beginning in 2015, all minimal risk noncompliance from all registered entities will be eligible for compliance exception treatment. Additional information about compliance exceptions is available in the Compliance Exception Overview document.[5]

The ERO Enterprise is gaining experience identifying appropriate CIP noncompliance for compliance exception treatment. A substantial portion of the compliance exceptions processed during the limited

[5] Compliance Exception Overview (Oct. 1, 2014), *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Compliance%20Exception%20Overview.pdf.

rollout of the program in 2013-2014 have resolved instances of noncompliance with CIP Reliability Standards.

Self-Logging Program

The self-logging program allows select registered entities with demonstrated effective management practices to self-monitor and identify, assess, and correct (i.e., mitigate) instances of noncompliance to log minimal risk noncompliance that would otherwise be individually self-reported. The Regional Entity confirms, following a periodic submission of the registered entity's log, that the registered entity has adequately identified and described the noncompliance, accurately assessed the risk, and appropriately mitigated the noncompliance. Once the review process is complete, the minimal risk issue is resolved as a compliance exception absent additional risk factors or other issues. This is consistent with the notion that noncompliance that is self-identified through internal controls, corrected through a strong compliance culture, and documented by the registered entity, should not be resolved through the enforcement process or incur a penalty, absent a higher risk to the BPS.

The experience of the ERO Enterprise to date has shown that logs increase visibility into noncompliance detected and corrected at the registered entity, as registered entities are more likely to record instances of noncompliance on their logs than self-report them. Further, the program fosters efficiency and reduces certain formal administrative processes associated with individual Self-Reports.

Participation in the self-logging program is voluntary. Also, the program is not limited to those CIP Version 5 Reliability Standards that originally contained the "identify, assess, and correct" language.

Additional information about the self-logging program, including eligibility, program operation, and the benefits of the program, is available in the Self-Logging of Minimal Risk Issues Program Overview.[6]

Example of Possible Risk-Based Enforcement Approach to CIP Version 5 Noncompliance

For this example, the ABC Co., which is described in the compliance monitoring portion of this document, is again referenced.

ABC Co. discovers that an employee completed CIP cybersecurity training 15 months and two weeks after the date the employee previously completed the training (CIP-004-5.1 R2). ABC Co. has identified this issue as posing a minimal risk to the reliability of the BPS.

If ABC Co. is allowed to self-log this noncompliance, it will log the noncompliance and actions taken to mitigate the noncompliance and prevent recurrence. Following review by the Regional Entity, there is a presumption that the noncompliance will be treated as a compliance exception unless the noncompliance is ineligible for such treatment (e.g., the noncompliance posed a greater than minimal risk, was the result of intentional or willful acts or omissions, or was the result of systemic or significant performance failures).

[6] Self-Logging of Minimal Risk Issues Program Overview (Oct. 1, 2014), *available at* http://www.nerc.com/pa/comp/Reliability%20Assurance%20Initiative/Self-logging%20of%20Minimal%20Risk%20Issues%20Program%20Overview.pdf.

If ABC Co. is not allowed to self-log this noncompliance, it may be considered for compliance exception treatment (although there is no presumption). In that case, ABC Co. is encouraged to submit a Self-Report to its Regional Entity.

If the Regional Entity discovered the noncompliance during a Compliance Audit, instead of ABC Co. discovering it on its own, the noncompliance would still be eligible for compliance exception treatment. Whether the minimal risk noncompliance will actually be afforded compliance exception treatment will be determined through a review of the facts and circumstances.

A Regional Entity may determine that compliance exception treatment is not appropriate, for example, when the following facts and circumstances are present:

- Employees have found a way to circumvent the internal controls ABC Co. has in place to ensure the timely completion of training;
- As a result of major turnover in ABC Co.'s compliance department, there is no longer any effective control, practice, or system to ensure training is completed in a timely manner;
- Employees are generally not aware of CIP obligations;
- Multiple employees at ABC Co. are completing training late (or not at all);
- ABC Co. did not discover the issue promptly;
- ABC Co. did not mitigate the issue promptly;
- The underlying issue was foreseeable and could easily happen again (poor internal controls).

In considering whether to afford compliance exception treatment, the Regional Entity may consider, for example, the following facts and circumstances as those weighing in favor of compliance exception treatment:

- ABC Co. had internal controls in place to ensure timely completion of training, including issuing automated training reminder emails and disabling network access when training is not completed on time. However, the employee was on an extended leave, so he did not see the emails or notice when his network access was disabled;
- ABC Co. self-identified the issue through regular reviews of its records;
- ABC Co. has a limited number of employees completing training late;
- ABC Co. experienced an unforeseeable technical issue;
- ABC Co. addressed the issue with its employee promptly;
- The employee completed CIP training in previous years;
- ABC Co. employees are generally aware of CIP obligations.

To summarize, if ABC Co. is allowed to self-log this noncompliance, there is a presumption that the noncompliance will be afforded compliance exception treatment. If ABC Co. is not allowed to self-log this noncompliance, there is no presumption of compliance exception treatment. However, the

noncompliance is still eligible for compliance exception treatment regardless of how it was discovered (e.g., Self-Report, Compliance Audit).

Exhibit I

Mapping Document

Project 2014-02 - CIP Version 5 Revisions

Mapping Document Showing Translation of the Version 5 standards into CIP-003-6, CIP-004-6, CIP-006-6, CIP-007-6, CIP-009-6, CIP-010-2, and CIP-011-2 (CIP-002-5.1, CIP-005-5, and CIP-008-5 were not modified)

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R1	CIP-003-6 R1	To incorporate a policy or policies for low impact BES Cyber Systems, the main requirement language was modified. "For its high impact and medium impact BES Cyber Systems" was struck from the language as new requirement parts were created. See below for part 1.1 and part 1.2 to see the change justification.
NEW	CIP-003-6 R1.1	"For its high impact and medium impact BES Cyber Systems" was added as a qualifier to the sub-parts below.
CIP-003-5 R1.1	CIP-003-6 R1.1.1	Requirement parts for 1.1 through 1.9 have become 1.1.1 through 1.1.9 with the clarifier added above in part 1.1 of CIP-003-6.
CIP-003-5 R1.2	CIP-003-6 R1.1.2	No change.
CIP-003-5 R1.3	CIP-003-6 R1.1.3	No change.
CIP-003-5 R1.4	CIP-003-6 R1.1.4	No change.
CIP-003-5 R1.5	CIP-003-6 R1.1.5	No change.
CIP-003-5 R1.6	CIP-003-6 R1.1.6	No change.
CIP-003-5 R1.7	CIP-003-6 R1.1.7	No change.
CIP-003-5 R1.8	CIP-003-6 R1.1.8	No change.
CIP-003-5 R1.9	CIP-003-6 R1.1.9	No change.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-003-6 R1.2	"For its assets identified in CIP-002 containing low impact BES Cyber Systems, if any:" was added as a qualifier to the sub-parts below.
CIP-003-5 R2	CIP-003-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. Furthermore, as the SDT modified its approach of using Attachment 1 instead of the table approach, it modified Requirement R2 to "implement one or more document cyber security plan(s) that include the applicable elements in Attachment 1."
CIP-003-5 R2.1	CIP-003-6 R1.2.1	The security awareness requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.1.
CIP-003-5 R2.2	CIP-003-6 R1.2.2	The physical security controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.2.

Standard: CIP-003-5 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-5 R2.3	CIP-003-6 R1.2.3	The electronic access controls requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.3. Furthermore, the SDT modified the "external routable protocol connections" as a new definition is being proposed by the SDT for "Low Impact External Routable Connectivity."
CIP-003-5 R2.4	CIP-003-6 R1.2.4	The incident response to a Cyber Security Incident requirement part for inclusion in one or more of the documented cyber security policies was moved to CIP-003-6, Requirement R1, Part 1.2.4.
NEW	CIP-003-6, Attachment 1	CIP-003-6 Attachment 1 lists the elements required for low impact asset cyber security plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the lack of objective criteria for Low Impact assets protections.
CIP-003-5 R3	CIP-003-6 R3	No change.
CIP-003-5 R4	CIP-003-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R1	CIP-004-6 R1	No change.
CIP-004-5.1 R1.1	CIP-004-6 R1.1	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2	CIP-004-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase "in a manner that identifies, assesses, and corrects deficiencies" was stricken. The SDT has also revised the requirement to allow Responsible Entities the flexibility to have one or more cyber security training programs, as the existing CIP-004-5 R2 had Responsible Entities shall implement "a cyber security training program(s)." That modification was made for clarity and consistency across the standards.
CIP-004-5.1 R2.1	CIP-004-6 R2.1	No change.
CIP-004-5.1 R2.1.1	CIP-004-6 R2.1.1	No change.
CIP-004-5.1 R2.1.2	CIP-004-6 R2.1.2	No change.
CIP-004-5.1 R2.1.3	CIP-004-6 R2.1.3	No change.
CIP-004-5.1 R2.1.4	CIP-004-6 R2.1.4	No change.
CIP-004-5.1 R2.1.5	CIP-004-6 R2.1.5	No change.
CIP-004-5.1 R2.1.6	CIP-004-6 R2.1.6	No change.
CIP-004-5.1 R2.1.7	CIP-004-6 R2.1.7	No change.
CIP-004-5.1 R2.1.8	CIP-004-6 R2.1.8	No change.
CIP-004-5.1 R2.1.9	CIP-004-6 R2.1.9	To respond to the FERC Order No. 791 directives regarding transient devices, the SDT has added Transient Cyber Assets and Removable Media as contents that must be included in a Registered Entity's cyber security training program. The training must address cyber security risks associated with a BES Cyber System's electronic interconnectivity and interoperability with Transient Cyber Assets and Removable Media.
CIP-004-5.1 R2.2	CIP-004-6 R2.2	No change.

Standard: CIP-004-5.1– Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-5.1 R2.3	CIP-004-6 R2.3	No change.
CIP-004-5.1 R3	CIP-004-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R3.1	CIP-004-6 R3.1	No change.
CIP-004-5.1 R3.2	CIP-004-6 R3.2	No change.
CIP-004-5.1 R3.2.1	CIP-004-6 R3.2.1	No change.
CIP-004-5.1 R3.2.2	CIP-004-6 R3.2.2	No change.
CIP-004-5.1 R3.3	CIP-004-6 R3.3	No change.
CIP-004-5.1 R3.4	CIP-004-6 R3.4	No change.
CIP-004-5.1 R3.5	CIP-004-6 R3.5	No change.
CIP-004-5.1 R4	CIP-004-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-004-5.1 R4.1	CIP-004-6 R4.1	No change.
CIP-004-5.1 R4.1.1	CIP-004-6 R4.1.1	No change.
CIP-004-5.1 R4.1.2	CIP-004-6 R4.1.2	No change.
CIP-004-5.1 R4.1.3	CIP-004-6 R4.1.3	No change.
CIP-004-5.1 R4.2	CIP-004-6 R4.2	No change.
CIP-004-5.1 R4.3	CIP-004-6 R4.3	No change.
CIP-004-5.1 R4.4	CIP-004-6 R4.4	No change.
CIP-004-5.1 R5	CIP-004-6 R5	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.

CIP-004-5.1 R5.5	CIP-004-6 R5.5	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-5 R1	CIP-006-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R1.1	CIP-006-6 R1.1	No change.
CIP-006-5 R1.2	CIP-006-6 R1.2	No change.
CIP-006-5 R1.3	CIP-006-6 R1.3	No change.
CIP-006-5 R1.4	CIP-006-6 R1.4	No change.
CIP-006-5 R1.5	CIP-006-6 R1.5	No change.
CIP-006-5 R1.6	CIP-006-6 R1.6	No change.
CIP-006-5 R1.7	CIP-006-6 R1.7	No change.
CIP-006-5 R1.8	CIP-006-6 R1.8	No change.
CIP-006-5 R1.9	CIP-006-6 R1.9	No change.

Standard: CIP-006-5 – Cyber Security—Physical Security of BES Cyber Systems		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-006-6 R1.10	To respond to the FERC Order No. 791 directive to protect the nonprogrammable components of communication networks, the SDT has added a new Requirement R1, Part 1.10 to restrict physical access to cabling and other nonprogrammable components used for communication between applicable Cyber Assets within the same Electronic Security Perimeter. There are three other mechanisms for an entity to adequately protect those networks, including encryption of data that transits such cabling and components; monitoring the status of the communication link and issuing alarms to detect communication failures; or an equally effective logical protection.
CIP-006-5 R2	CIP-006-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-006-5 R2.1	CIP-006-6 R2.1	No change.
CIP-006-5 R2.2	CIP-006-6 R2.2	No change.
CIP-006-5 R2.3	CIP-006-6 R2.3	No change.
CIP-006-5 R3	CIP-006-6 R3	No change.
CIP-006-5 R3.1	CIP-006-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R1	CIP-007-6 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R1.1	CIP-007-6 R1.1	No change.
CIP-007-5 R1.2	CIP-007-6 R1.2	The applicable systems column was modified to include the Protected Cyber Assets and nonprogrammable communication components located inside both a Physical Security Perimeter and an Electronic Security Perimeter. The protection against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media for these additions address the communication networks directive from FERC Order No. 791. Removable Media was capitalized in the requirement because it is newly defined.
CIP-007-5 R2	CIP-007-6 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R2.1	CIP-007-6 R2.1	No change.
CIP-007-5 R2.2	CIP-007-6 R2.2	No change.
CIP-007-5 R2.3	CIP-007-6 R2.3	No change.
CIP-007-5 R2.4	CIP-007-6 R2.4	No change.
CIP-007-5 R3	CIP-007-6 R3	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R3.1	CIP-007-6 R3.1	No change.

Standard: CIP-007-5 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-5 R3.2	CIP-007-6 R3.2	No change.
CIP-007-5 R3.3	CIP-007-6 R3.3	No change.
CIP-007-5 R4	CIP-007-6 R4	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-007-5 R4.1	CIP-007-6 R4.1	No change.
CIP-007-5 R4.1.1	CIP-007-6 R4.1.1	No change.

CIP-010-1 R1.5.2	CIP-010-2 R1.5.2	No change.
CIP-010-1 R2	CIP-010-2 R2	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-010-1 R2.1	CIP-010-2 R2.1	No change.
CIP-010-1 R3	CIP-010-2 R3	No change.
CIP-010-1 R3.1	CIP-010-2 R3.1	No change.
CIP-010-1 R3.2	CIP-010-2 R3.2	No change.

Standard: CIP-010-1 – Cyber Security—Configuration Change Management and Vulnerability Assessments		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-010-1 R3.2.1	CIP-010-2 R3.2.1	No change.
CIP-010-1 R3.2.2	CIP-010-2 R3.2.2	No change.
CIP-010-1 R3.3	CIP-010-2 R3.3	No change.
CIP-010-1 R3.4	CIP-010-2 R3.4	No change.
NEW	CIP-010-2 R4	To respond to the FERC Order No. 791 directive to address transient devices, the SDT modified its approach to use Attachment 1 instead of the table approach. It modified Requirement R4 to "implement one or more documented plan(s) for Transient Cyber Asset and Removable Media that include the applicable elements in Attachment 1, except under CIP Exceptional Circumstances."
NEW	CIP-010-2, Attachment 1	CIP-010-2 Attachment 1 lists the elements required for Transient Cyber Asset and Removable Media Plan(s). The attachment satisfies the directive from FERC Order No. 791 on addressing the risks posed by transient devices.

Standard: CIP-011-1 – Cyber Security—Information Protection		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-011-1 R1	CIP-011-2 R1	To respond to the FERC Order No. 791 directive to remove ambiguous language from the requirement, the phrase “in a manner that identifies, assesses, and corrects deficiencies” was stricken.
CIP-011-1 R1.1	CIP-011-2 R1.1	No change.
CIP-011-1 R1.2	CIP-011-2 R1.2	No change.
CIP-011-1 R2	CIP-011-2 R2	No change.
